1 Globus GSI Proxy SSL API

The `globus_gsi_proxy_ssl` library provides the ability to create a PROXYCERTINFO extension for inclusion in an X509 certificate. The current specification for the extension is described in the Internet Draft Document: `draft-ietf-pkix-proxy-08.txt`

The library conforms to the ASN1 implementation in the OPENSSL library (0.9.6, formerly SSLeay), and provides an interface to convert from a DER encoded PROXYCERTINFO to its internal structure and vice-versa.

2 globus gsi proxy ssl Module Index

2.1 globus gsi proxy ssl Modules

Here is a list of all modules:

ProxyCertInfo	2
ProxyPolicy	7

3 globus gsi proxy ssl Data Structure Index

3.1 globus gsi proxy ssl Data Structures

Here are the data structures with brief descriptions:

PROXYCERTINFO_st	11
PROXPOLICY_st	11

4 globus gsi proxy ssl Module Documentation

4.1 ProxyCertInfo

Data Structures

- struct `PROXYCERTINFO_st`

ASN1_METHOD

- ASN1_METHOD `PROXYCERTINFO_asn1_meth()`

New

- `PROXYCERTINFO PROXYCERTINFO_new()`

Free.

- void `PROXYCERTINFO_free(PROXYCERTINFO cert_info)`

Duplicate

- `PROXYCERTINFO PROXYCERTINFO_dup(PROXYCERTINFO cert_info)`

Compare

- int `PROXYCERTINFO_cmp(const PROXYCERTINFO a, const PROXYCERTINFO b)`

Print to a BIO stream

- int `PROXYCERTINFO_print(BIO bp, PROXYCERTINFO cert_info)`

Print To Stream

- int `PROXYCERTINFO_print_fp(FILE fp, PROXYCERTINFO cert_info)`

Set the Policy Field

- int `PROXYCERTINFO_set_policy(PROXYCERTINFO cert_info, PROXPOLICY policy)`

Get the Policy Field

- `PROXPOLICY PROXYCERTINFO_get_policy(PROXYCERTINFO cert_info)`

Set the Path Length Field

- int `PROXYCERTINFO_set_path_length(PROXYCERTINFO cert_info, long path_length)`

Get Path Length Field

- long `PROXYCERTINFO_get_path_len(``PROXYCERTINFO` cert_info)

Convert PROXYCERTINFO to DER encoded form

- int `i2d_PROXYCERTINFO(``PROXYCERTINFO` cert_info, unsigned char pp)

Convert a PROXYCERTINFO to internal form

- `PROXYCERTINFO_d2i_PROXYCERTINFO(``PROXYCERTINFO` cert_info, unsigned char pp, long length)

Convert old PROXYCERTINFO to DER encoded form

- int `i2d_PROXYCERTINFO_OLD(``PROXYCERTINFO` cert_info, unsigned char pp)

Convert a old PROXYCERTINFO to internal form

- `PROXYCERTINFO_d2i_PROXYCERTINFO_OLD(``PROXYCERTINFO` cert_info, unsigned char pp, long length)

4.1.1 Detailed Description

Author:

Sam Meder
Sam Lang

The `proxycertinfo.h` file defines a method of maintaining information about proxy certificates.

4.1.2 Function Documentation

4.1.2.1 ASN1_METHOD PROXYCERTINFO_asn1_meth ()

Defines the functions required for manipulating a PROXYCERTINFO and its ASN1 form.

Creates an ASN1_METHOD structure, which contains pointers to routines that convert any PROXYCERTINFO structure to its associated ASN1 DER encoded form and vice-versa.

Returns:

the ASN1_METHOD object

4.1.2.2 PROXYCERTINFO PROXYCERTINFO_new ()

Create a new PROXYCERTINFO.

Allocates and initializes a new PROXYCERTINFO structure.

Returns:

pointer to the new PROXYCERTINFO

4.1.2.3 void PROXYCERTINFO_free ([PROXYCERTINFO](#) cert_info)

Free a PROXYCERTINFO.

Parameters:

cert_info pointer to the PROXYCERTINFO structure to be freed.

4.1.2.4 [PROXYCERTINFO](#) PROXYCERTINFO_dup ([PROXYCERTINFO](#) cert_info)

Makes a copy of a PROXYCERTINFO.

Makes a copy of a PROXYCERTINFO structure

Parameters:

cert_info the PROXYCERTINFO structure to copy

Returns:

the copied PROXYCERTINFO structure

4.1.2.5 int PROXYCERTINFO_cmp (const[PROXYCERTINFO](#) a, const[PROXYCERTINFO](#) b)

Compares two PROXYCERTINFO structures

Parameters:

a pointer to the first PROXYCERTINFO structure

b pointer to the second PROXYCERTINFO structure

Returns:

an integer - the result of the comparison. The comparison compares each of the fields, so if any of those fields are not equal then a nonzero value is returned. Equality is indicated by returning a 0.

4.1.2.6 int PROXYCERTINFO_print (BIO bp, [PROXYCERTINFO](#) cert_info)

print the PROXYCERTINFO structure to stdout

Parameters:

bp the BIO to print to

cert_info the PROXYCERTINFO to print

Returns:

1 on success, 0 on error

4.1.2.7 int PROXYCERTINFO_print_fp (FILE fp, [PROXYCERTINFO](#) cert_info)

print the PROXYCERTINFO structure to the specified file stream

Parameters:

fp the file stream (FILE) to print to

cert_info the PROXYCERTINFO structure to print

Returns:

the number of characters printed

4.1.2.8 int PROXYCERTINFO_set_policy (PROXYCERTINFO cert_info, PROXPOLICY policy)

Sets the policy on the PROXYCERTINFO Since this is an optional field in the ASN1 encoding, this variable can be set to NULL through this function - which means that when the PROXYCERTINFO is encoded the policy won't be included.

Parameters:

cert_info the PROXYCERTINFO object to set the policy of
policy the PROXPOLICY to set it to

Returns:

1 if success, 0 if error

4.1.2.9 PROXPOLICY PROXYCERTINFO_get_policy (PROXYCERTINFO cert_info)

Gets the policy on the PROXYCERTINFO

Parameters:

cert_info the PROXYCERTINFO to get the policy of

Returns:

the PROXPOLICY of the PROXYCERTINFO

4.1.2.10 int PROXYCERTINFO_set_path_length (PROXYCERTINFO cert_info, long path_length)

Sets the path length of the PROXYCERTINFO. The path length specifies the maximum depth of the path of the Proxy Certificates that can be signed by an End Entity Certificate (EEC) or Proxy Certificate.

Since this is an optional field in its ASN1 coded representation, it can be set to NULL through this function - which means that it won't be included in the encoding.

Parameters:

cert_info the PROXYCERTINFO to set the path length of
path_length the path length to set it to if -1 is passed in, the path length gets unset, which configures the PROXYCERTINFO to not include the path length in the DER encoding

Returns:

1 on success, 0 on error

4.1.2.11 long PROXYCERTINFO_get_path_length (PROXYCERTINFO cert_info)

Gets the path length of the PROXYCERTINFO.

See also:

[PROXYCERTINFO_set_path_length](#)

Parameters:

cert_info the PROXYCERTINFO to get the path length from

Returns:

the path length of the PROXYCERTINFO, or -1 if not set

4.1.2.12 int i2d_PROXYCERTINFO (PROXYCERTINFO cert_info, unsigned char pp)

Converts the PROXYCERTINFO structure from internal format to a DER encoded ASN.1 string

Parameters:

cert_info the PROXYCERTINFO structure to convert

pp the resulting DER encoded string

Returns:

the length of the DER encoded string

4.1.2.13 PROXYCERTINFO d2i_PROXYCERTINFO (PROXYCERTINFO cert_info, unsigned char pp, long length)

Convert from a DER encoded ASN.1 string of a PROXYCERTINFO to its internal structure

Parameters:

cert_info the resulting PROXYCERTINFO in internal form

pp the DER encoded ASN.1 string containing the PROXYCERTINFO

length the length of the buffer

Returns:

the resultingin PROXYCERTINFO in internal form

4.1.2.14 int i2d_PROXYCERTINFO_OLD (PROXYCERTINFO cert_info, unsigned char pp)

Converts the old PROXYCERTINFO structure from internal format to a DER encoded ASN.1 string

Parameters:

cert_info the old PROXYCERTINFO structure to convert

pp the resulting DER encoded string

Returns:

the length of the DER encoded string

4.1.2.15 PROXYCERTINFO d2i_PROXYCERTINFO_OLD (PROXYCERTINFO cert_info, unsigned char pp, long length)

Convert from a DER encoded ASN.1 string of a old PROXYCERTINFO to its internal structure

Parameters:

cert_info the resulting old PROXYCERTINFO in internal form

pp the DER encoded ASN.1 string containing the old PROXYCERTINFO

length the length of the buffer

Returns:

the resulting old PROXYCERTINFO in internal form

4.2 ProxyPolicy

Data Structures

- struct `PROXPOLICY_st`

Get a method for ASN1 conversion

- ASN1_METHOD `PROXPOLICY_asn1_meth()`

New

- `PROXPOLICY PROXPOLICY_new()`

Free

- `void PROXPOLICY_free(PROXPOLICY policy)`

Duplicate

- `PROXPOLICY PROXPOLICY_dup(PROXPOLICY policy)`

Compare

- `int PROXPOLICY_cmp(const PROXPOLICY a, const PROXPOLICY b)`

Print to a BIO stream

- `int PROXPOLICY_print(BIO bp, PROXPOLICY policy)`

Print to a File Stream

- `int PROXPOLICY_print_fp(FILE fp, PROXPOLICY policy)`

Set the Policy Language Field

- `int PROXPOLICY_set_policy_language(PROXPOLICY policy, ASN1_OBJECT policy_language)`

Get the Policy Language Field

- `ASN1_OBJECT PROXPOLICY_get_policy_language(PROXPOLICY policy)`

Set the Policy Field

- `int PROXPOLICY_set_policy(PROXPOLICY proxypolicy, unsigned char policy, int length)`

Get the Policy Field

- unsigned char `PROXPOLICY_get_policy(PROXPOLICY policy, int length)`

Convert from Internal to DER encoded form

- int `i2d_PROXPOLICY(PROXPOLICY a, unsigned char pp)`

Convert from DER encoded form to Internal

- `PROXPOLICY d2i_PROXPOLICY(PROXPOLICY a, unsigned char pp, long length)`

4.2.1 Detailed Description

Author:

Sam Meder
Sam Lang

The proxypolicy set of data structures and functions provides an interface to generating a PROXPOLICY structure which is maintained as a field in the PROXYCERTINFO structure, and ultimately gets written to a DER encoded string.

See also:

Further Information about proxy policies is available in [X.509 Proxy Certificate Profile](#) document.

4.2.2 Function Documentation

4.2.2.1 ASN1_METHOD PROXPOLICY_asn1_meth ()

Creates an ASN1_METHOD structure, which contains pointers to routines that convert any PROXPOLICY structure to its associated ASN1 DER encoded form and vice-versa.

Returns:

the ASN1_METHOD object

4.2.2.2 PROXPOLICY PROXPOLICY_new ()

Allocates and initializes a new PROXPOLICY structure.

Returns:

pointer to the new PROXPOLICY

4.2.2.3 void PROXPOLICY_free (PROXPOLICY policy)

Frees a PROXPOLICY

Parameters:

policy the proxy policy to free

4.2.2.4 `PROXPOLICY PROXPOLICY_dup (PROXPOLICY policy)`

Makes a copy of the proxypolicy - this function allocates space for a new PROXPOLICY, so the returned PROXPOLICY must be freed when its no longer needed

Parameters:

policy the proxy policy to copy

Returns:

the new PROXPOLICY

4.2.2.5 `int PROXPOLICY_cmp (constPROXPOLICY a, constPROXPOLICY b)`

Compares two PROXPOLICY structs for equality This function first compares the policy language numeric id's, if they're equal, it then compares the two policies.

Returns:

0 if equal, nonzero if not

4.2.2.6 `int PROXPOLICY_print (BIO bp, PROXPOLICY policy)`

Prints the PROXPOLICY struct using the BIO stream

Parameters:

bp the BIO stream to print to

policy the PROXPOLICY to print

Returns:

1 on success, 0 on error

4.2.2.7 `int PROXPOLICY_print_fp (FILE fp, PROXPOLICY policy)`

Prints the PROXPOLICY to the file stream FILE

Parameters:

fp the FILE stream to print to

policy the PROXPOLICY to print

Returns:

number of bytes printed, -2 or -1 on error

4.2.2.8 `int PROXPOLICY_set_policy_language (PROXPOLICY policy, ASN1_OBJECT policy_language)`

Sets the policy language of the PROXPOLICY

Parameters:

policy the PROXPOLICY to set the policy language of

policy_language the policy language to set it to

Returns:

1 on success, 0 on error

4.2.2.9 ASN1_OBJECT PROXPOLICY_get_policy_language ([PROXPOLICY](#) policy)

Gets the policy language of the PROXPOLICY

Parameters:

policy the proxy policy to get the policy language of

Returns:

the policy language as an ASN1_OBJECT

4.2.2.10 int PROXPOLICY_set_policy ([PROXPOLICY](#) proxypolicy, unsigned char policy, int length)

Sets the policy of the PROXPOLICY

Parameters:

proxypolicy the proxy policy to set the policy of

policy the policy to set it to

length the length of the policy

Returns:

1 on success, 0 on error

4.2.2.11 unsigned char PROXPOLICY_get_policy ([PROXPOLICY](#) policy, int length)

Gets the policy of a PROXPOLICY

Parameters:

policy the PROXPOLICY to get the policy of

length the length of the returned policy - this value gets set by this function

Returns:

the policy

4.2.2.12 int i2d_PROXPOLICY ([PROXPOLICY](#) a, unsigned char pp)

Converts a PROXPOLICY from its internal structure to a DER encoded form

Parameters:

a the PROXPOLICY to convert

pp the buffer to put the DER encoding in

Returns:

the length of the DER encoding in bytes

4.2.2.13 **PROXPOLICY** d2i_PROXPOLICY (**PROXPOLICY** a, unsigned char pp, long length)

Converts the PROXPOLICY from its DER encoded form to an internal PROXPOLICY structure

Parameters:

- a the PROXPOLICY struct to set
- pp the DER encoding to get the PROXPOLICY from
- length the length of the DER encoding

Returns:

the resulting PROXPOLICY in its internal structure form - this variable has been allocated using _new routines, so it needs to be freed once its no longer used

5 globus gsi proxy ssl Data Structure Documentation

5.1 PROXYCERTINFO_st Struct Reference

5.1.1 Detailed Description

This typedef maintains information about a proxy certificate.

Note:

NOTE: The API provides functions to manipulate the elds of a PROXYCERTINFO. Accessing the elds directly is not a good idea.

Parameters:

- path_length an optional eld in the ASN.1 DER encoding, it specifies the maximum depth of the path of Proxy Certificates that can be signed by this End Entity Certificate or Proxy Certificate.
- policy a non-optional eld in the ASN.1 DER encoding, specifies policies on the use of this certificate.

5.2 PROXPOLICY_st Struct Reference

5.2.1 Detailed Description

Note:

NOTE: The API provides functions to manipulate the elds of a PROXPOLICY. Accessing the elds directly will not work.

This typedef maintains information about the policies that have been placed on a proxy certificate

Parameters:

- policy_languagedefines which policy language is to be used to define the policies
- policy the policy that determines the policies on a certificate
