## 1 globus rls client Main Page

The Globus Replica Location Service (RLS) C API provides functions to view and update data in a RLS catalog. There are 2 types of RLS servers, Local Replica Catalog (LRC) servers, which maintain Logical to Physical File Name mappings (LFN to PFN), and Replica Location Index (RLI) servers, which maintain LFN to LRC mappings. Note an RLS server can act as both an LRC and RLI server.

Functions are divided into the following groups:

- [Activation](#)
- [Connection Management](#)
- [Operations on an LRC server](#)
- [Operations on an RLI server](#)
- [Miscellaneous Types and Functions](#)
- [Query Results](#)
- [Status Codes](#)

Applications using this API should include [globus\\_rls\\_client.h](#), and be linked with the library `globus_rls_client_FLAVOR`.

#### 4.1.1 Detailed Description

All of the functions in the API that return status return it in a `globus_result_t` structure.

Prior to version 2.0.0 an integer status was returned. The `globus_result_t` structure includes an integer "type" which is set to one of the status codes defined below (the same values that were returned by earlier versions of the API). The function `globus_qls_client_error_info` may be used to extract the status code and/or error message from a `globus_result_t`. GLOBUS\_SUCCESS is returned when the operation was successful.

#### 4.1.2 Define Documentation

Most operations require the admin privilege.

Parameters:

- h Handle connected to RLS server.
- cmd Command to be sent to RLS server.

Return values:

- GLOBUS\_SUCCESS Command succeeded.

4.2.4.2 [globus\\_result\\_t globus\\_rls\\_client\\_get\\_configuration\(\[globus\\\_rls\\\_handle\\\_t\]\(#\) h, char option, \[globus\\\_list\\\_t\]\(#\) conf\\_list\)](#)

Return values:

- conf\_list List of configuration options.
- GLOBUS\_SUCCESS List of retrieved configuration options returned in conf\_list, each datum is of type [globus\\_rls\\_string2\\_t](#). conf\_list should be freed with [globus\\_rls\\_client\\_free\\_list\(\)](#). There may be multiple "acl" entries in the list, since the access control list can include more than one entry. Each acl configuration value consists of a regular expression (matched against grid-maple users or DNs), a colon, and space separated list of permissions the matching users are granted.

4.2.4.3 [globus\\_result\\_t globus\\_rls\\_client\\_set\\_configuration\(\[globus\\\_rls\\\_handle\\\_t\]\(#\) h, char option, char value\)](#)

option Configuration option to set.

value New value for option.

Return values:

GLOBUS\_SUCCESS Option set on server.

4.2.4.4 `globus_result_t globus_qls_client_stats(globus\_qls\_handle\_t h, globus\_qls\_stats\_t qlsstats)`

4.2.4.5 `char globus_qls_client_attr2s(globus\_qls\_attribute\_t attr, char buf, int buflen)`

Map attribute value to string.

Parameters:

attr Attribute to convert. If attr->type is [globus\\_qls\\_attr\\_type\\_date](#) then the resulting string will be in the format MySQL uses by default, which is YYYYMMDDHHMMSS.

buf Buffer to write string value to. Note attr->type is [globus\\_qls\\_attr\\_type\\_string](#) then attr->value is returned, and buf is unused.

bu len Size of buf in bytes.

Return values:

String Value Attribute value converted to a string.

4.2.4.6 `globus_result_t globus_qls_client_s2attr(globus\_qls\_attr\_type\_t type, char sval, globus\_qls\_attribute\_t attr)`

Set [globus\\_qls\\_attribute\\_t](#) type and value fields from a type and string value.

Parameters:

type Attribute value type.

sval String value to convert to binary. If type is [globus\\_qls\\_attr\\_type\\_date](#) sval should be in the form YYYY-MM-DD HH:MM:SS.

attr Attribute whose type and value fields are to be set.

- `rc` Address to store error code at. If NULL error code is not returned.
- `buf` Address to store error message at. If NULL error message is not returned.
- `preserve` If `GLOBUS_TRUE` then a new `globus_result_t` is constructed with the same values as the old and returned as the function value.
- `bu en` Size of `buf`.

Return values:

- `globus_result_t` If `preserve` is set a new `globus_result_t` identical to `rc` is returned, otherwise `GLOBUS_SUCCESS`.

4.2.4.8 `int globus_list_len (globus_list_t len)`

Compute length of list.

`globus_list_size()` is implemented using recursion, besides being inefficient it can run out of stack space when the list is large.

4.2.4.9 `char globus_qls_errmsg (int rc, char specimsg char buf, int buflen)`

Map RLS status code to error string.

Parameters:

- `rc` Status code.

Return values:

- `char` Returns `buf`, error message written to `buf`.

## 4.3 Query Results

List results are returned as `globus_list_t`'s, list datums depend on the type of query (e.g. `globus_qls_string2_t`, `globus_qls_attribute_t` etc).

Data Structures

- `struct globus_qls_attribute_object_t`  
`globus_qls_client_attr_search()` returns a list of these structures which include the object name (LFN or PFN) and attribute value found by the query.
- `struct globus_qls_string2_t`
- `struct globus_qls_string2_bulk_t`

## Functions

- `globus_result_t globus_rls_client_free_list(globus_list_t list)`

### 4.3.1 Detailed Description

List results are returned as `globus_list_t`'s, list datums depend on the type of query (`globus_rls_string2_t`, `globus_rls_attribute_t`, etc).

A list result should be freed with `globus_rls_client_free_list()` when it's no longer needed. RLS supports limiting the number of results returned by a single query using an offset and reslimit. The offset specifies which result to begin with, reslimit specifies how many results to return. Offset should begin at 0 to retrieve all records. If reslimit is 0 then all results are returned at once, unless the server has a limit on results configured. If NULL is passed as the offset argument then the API will repeatedly call the query function until all results are retrieved. The following are equivalent examples of how to print the lfn,pfn pairs returned by `globus_rls_client_lrc_get_lfn()`

```
globus_list_t *str2_list;
globus_list_t *p;
globus_rls_string2_t *str2;

// Retrieve all results, API will handle looping through partial results
// if the server has a limit configured. Error handling has been omitted.
globus_rls_client_lrc_get_lfn(h, "somepfn", NULL, 0, &str2_list);
for (p = str2_list; p; p = globus_list_rest(p)) {
    str2 = (globus_rls_string2_t *) globus_list_first(p);
    printf("lfn: %s pfn:%s\n", str2->s1, str2->s2);
}
globus_rls_client_free_list(str2_list);

// This code fragment retrieves results 5 at a time. Note offset is set
// to -1 when the server has no more results to return.
int offset = 0;

while (globus_rls_client_lrc_get_lfn(h, "somepfn", &offset, 5, &str2_list) == GLOBUS_SUCCESS) {
    for (p = str2_list; p; p = globus_list_rest(p)) {
        str2 = (globus_rls_string2_t *) globus_list_first(p);
        printf("lfn: %s pfn:%s\n", str2->s1, str2->s2);
    }
    globus_rls_client_free_list(str2_list);
    if (offset == -1)
        break;
}
```
