## 3 globus gsi cert utils Module Documentation

### 3.1 Activation

Globus GSI Cert Utils uses standard Globus module activation and deactivation.

#### Defines

- #define [GLOBUS\\_GSI\\_CERT\\_UTILS\\_MODULE](#)

#### 3.1.1 Detailed Description

Globus GSI Cert Utils uses standard Globus module activation and deactivation.

Before any Globus GSI Cert Utils functions are called, the following function must be called:

```
globus_module_activate(GLOBUS_GSI_CERT_UTILS_MODULE)
```

This function returns `GLOBUS_SUCCESS` if Globus GSI Credential was successfully initialized, and you are therefore allowed to subsequently call Globus GSI Cert Utils functions. Otherwise, an error code is returned, and Globus GSI Cert Utils functions should not be subsequently called. This function may be called multiple times.

To deactivate Globus GSI Cert Utils, the following function must be called:

```
globus_module_deactivate(GLOBUS_GSI_CERT_UTILS_MODULE)
```

This function should be called once for each time Globus GSI Cert Utils was activated.

### 3.1.2 Define Documentation

#### 3.1.2.1 #define GLOBUS\_GSI\_CERT\_UTILS\_MODULE

Module descriptor.

## 3.2 Cert Utils Functions

A generic set of utility functions for manipulating OpenSSL objects, such as X509 certificates.

### Convert ASN1\_UTCTIME to time\_t

- `globus_result_t globus_gsi_cert_utils_make_time` (ASN1\_UTCTIME \*ctm, time\_t \*newtime)

### Get the X509 certificate type (EEC, CA, proxy type, etc.)

- `globus_result_t globus_gsi_cert_utils_get_cert_type` (X509 \*cert, `globus_gsi_cert_utils_cert_type_t` \*type)

### Get the certificate name

- `globus_result_t globus_gsi_cert_utils_get_x509_name` (char \*subject\_string, int length, X509\_NAME \*x509\_name)

### Get the base certificate name

- `globus_result_t globus_gsi_cert_utils_get_base_name` (X509\_NAME \*subject, STACK\_OF(X509)\*cert\_chain)

### Functions

- `globus_result_t globus_gsi_cert_utils_get_eec` (STACK\_OF(X509)\*cert\_chain, X509 \*\*eec)

#### 3.2.1 Detailed Description

A generic set of utility functions for manipulating OpenSSL objects, such as X509 certificates.

### 3.2.2 Function Documentation

#### 3.2.2.1 `globus_result_t globus_gsi_cert_utils_make_time (ASN1_UTCTIME * ctm, time_t * newtime)`

Convert a ASN1\_UTCTIME structure to a time\_t.

**Parameters:**

*ctm* The ASN1\_UTCTIME to convert

*newtime* The converted time

**Returns:**

GLOBUS\_SUCCESS or an error captured in a globus\_result\_t

#### 3.2.2.2 `globus_result_t globus_gsi_cert_utils_get_cert_type (X509 * cert, globus_gsi_cert_utils_cert_type_t * type)`

Determine the type of the given X509 certificate For the list of possible values returned, see globus\_gsi\_cert\_utils\_cert\_type\_t.

**Parameters:**

*cert* The X509 certificate

*type* The returned X509 certificate type

**Returns:**

GLOBUS\_SUCCESS or an error captured in a globus\_result\_t

#### 3.2.2.3 `globus_result_t globus_gsi_cert_utils_get_x509_name (char * subject_string, int length, X509_NAME * x509_name)`

Get the X509\_NAME from a subject string.

OpenSSL doesn't provide this function, probably because it shouldn't be used. If you are getting an X509\_NAME from just a string, its impossible to verify its integrity.

**Parameters:**

*subject\_string* The subject in the format: "/O=Grid/OU=..."

*length* The length of the subject string

*x509\_name* The resulting X509\_NAME object

**Returns:**

GLOBUS\_SUCCESS unless an error occurred, in which case, a globus error object ID is returned

#### 3.2.2.4 `globus_result_t globus_gsi_cert_utils_get_base_name (X509_NAME * subject, STACK_OF(X509)* cert_chain)`

Get the base name of a proxy certificate.

Given an X509 name, strip off the proxy related /CN components to get the base name of the certificate's subject

**Parameters:**

*subject* Pointer to an X509\_NAME object which gets stripped

*cert\_chain* The certificate chain used to detect the number of CNs to strip. This is done by figuring out the number of proxies in the chain.

**Returns:**

GLOBUS\_SUCCESS

### 3.2.2.5 globus\_result\_t globus\_gsi\_cert\_utils\_get\_eec (STACK\_OF(X509)\* cert\_chain, X509 \*\* eec)

Get the end-entity certificate associated with a certificate chain.

#### Parameters:

*cert\_chain* Certificate chain to inspect.

*eec* Pointer to be set to the EEC value from within the cert chain. Must freed by the caller.

### 3.3.1 Typedef Documentation

#### 3.3.1.1 typedef enum [globus\\_gsi\\_cert\\_utils\\_cert\\_type\\_e](#) [globus\\_gsi\\_cert\\_utils\\_cert\\_type\\_t](#)

Certificate Types.

These certificate types are used to describe some properties of a certificate and to specify what type of proxy should be generated in the proxy core code. There are two non-proxy types of certificates understood by Globus: EEC (End-Entity Certificate) and CA (Certificate Authority Certificates), three proxy formats (GSI 2 "legacy" proxies, GSI 3 "Draft" proxies, and RFC 3820-compliant proxies), and four types of proxy (limited, impersonation "full", restricted, and independent). The latter two types are not expressible in the GSI 2 format.

In addition to enumerations for the concrete renderings of certificate format and type combined, there are default, formats-without-types and types-without-formats so that application logic which uses the proxy library can request default proxy formats which are compatible with the issuing certificate.

### 3.3.2 Enumeration Type Documentation
