ARC::DataMove Hierarchical Index

1.1 ARC::DataMove Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

DataBroker	5
DataBufferPar	6
DataCallback	16
DataCache	12
DataHandle	17
DataHandleCommon	
DataHandle::analyze_t	21
DataHandleFile	
DataHandleFTP	
DataHandleHTTPg	
DataHandleSRM	
DataMove	22
DataMovePar	27
DataPoint	29
DataPointDirect	40
DataPointFile	
DataPointFTP	
DataPointHTTP	
DataPointMeta	50
DataPointLFC	
DataPointRC	
DataPointRLS	
DataPointSRM	
DataPoint::FileInfo	38
DataPointDirect::Location	49
DataSpeed	54

Chapter 2

ARC::DataMove Class Index

2.1 ARC::DataMove Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

DataBroker	5
DataBufferPar	6
DataCache	12
DataCallback	16
DataHandle	17
DataHandle::analyze_t	21
DataMove	22
DataMovePar (Wrapper around DataMove class to handle few transfers at once)	27
DataPoint	29
DataPoint::FileInfo	38
DataPointDirect	40
DataPointDirect::Location	49
DataPointMeta	50
DataSpeed	54

Chapter 3

ARC::DataMove Class Documentation

3.1 DataBroker Class Reference

3.2.1 Detailed Description

This class represents set of buffers used during data transfer.

3.2.2 Constructor & Destructor Documentation

3.2.2.1 DataBufferPar::DataBufferPar (unsigned int *size* = 65536, int *blocks* = 3)

Contructor

Parameters:

size size of every buffer in bytes.

blocks number of buffers.

3.2.2.2 DataBufferPar::DataBufferPar (Checksum * *cksum*, unsigned int *size* = 65536, int *blocks* = 3)

Contructor

Parameters:

size size of every buffer in bytes.

blocks number of buffers.

cksum object which will compute checksum. Should not be destroyed till DataBufferPar itself.

3.2.2.3 DataBufferPar::~DataBufferPar (void)

Destructor.

3.2.3 Member Function Documentation

3.2.3.1 unsigned int DataBufferPar::buffer_size (void)

Returns size of buffer in object. If not initialized then this number represents size of default buffer.

3.2.3.2 const CheckSum* DataBufferPar::checksum_object (void)

Returns CheckSum object specified in constructor.

3.2.3.3 bool DataBufferPar::checksum_valid (void)

Returns true if checksum was successfully computed.

3.2.3.4 unsigned long long int DataBufferPar::eof_position (void) const [inline]

Returns offset following last piece of data transfered.

3.2.3.5 bool DataBufferPar::eof_read (void)

Returns true if object was informed about end of transfer on 'read' side.

3.2.3.6 void DataBufferPar::eof_read (bool v)

Informs object if there will be no more request for 'read' buffers. v true if no more requests.

3.2.3.7 bool DataBufferPar::eof_write (void)

Returns true if object was informed about end of transfer on 'write' side.

3.2.3.8 void DataBufferPar::eof_write (bool v)

Informs object if there will be no more request for 'write' buffers. v true if no more requests.

3.2.3.9 bool DataBufferPar::error (void)

Returns true if object was informed about error or internal error occurred.

3.2.3.10 bool DataBufferPar::error_read (void)

Returns true if object was informed about error on 'read' side.

3.2.3.11 void DataBufferPar::error_read (bool v)

Informs object if error occurred on 'read' side.

Parameters:

v true if error.

3.2.3.12 bool DataBufferPar::error_transfer (void)

Returns true if error occurred inside object.

3.2.3.13 bool DataBufferPar::error_write (void)

Returns true if object was informed about error on 'write' side.

3.2.3.14 void DataBufferPar::error_write (bool v)

Informs object if error occurred on 'write' side.

Parameters:

v true if error.

3.2.3.15 bool DataBufferPar::for_read ()

Check if there are buffers which can be taken by [for_read\(\)](#). This function checks only for buffers and does not take eof and error conditions into account.

3.2.3.16 bool DataBufferPar::for_read (int & *handle*, unsigned int & *length*, bool *wait*)

Request buffer for READING INTO it.

Parameters:

handle returns buffer's number.

length returns size of buffer

wait if true and there are no free buffers, method will wait for one. Returns true on success

3.2.3.17 bool DataBufferPar::for_write (void)

Check if there are buffers which can be taken by [for_write\(\)](#). This function checks only for buffers and does not take eof and error conditions into account.

3.2.3.18 bool DataBufferPar::for_write (int & *handle*, unsigned int & *length*, unsigned long long int & *offset*, bool *wait*)

Request buffer for WRITING FROM it.

Parameters:

handle returns buffer's number.

length returns size of buffer

wait if true and there are no free buffers, method will wait for one.

3.2.3.19 bool DataBufferPar::is_notwritten (char * *buf*)

Informs object that data was NOT written from buffer (and releases buffer).

Parameters:

buf - address of buffer

3.2.3.20 bool DataBufferPar::is_notwritten (int *handle*)

Informs object that data was NOT written from buffer (and releases buffer).

Parameters:

handle buffer's number.

3.2.3.21 bool DataBufferPar::is_read (char * *buf*, unsigned int *length*, unsigned long long int *offset*)

Informs object that data was read into buffer.

Parameters:

buf - address of buffer

length amount of data.

offset offset in stream, file, etc.

3.2.3.22 bool DataBufferPar::is_read (int *handle*, unsigned int *length*, unsigned long long int *offset*)

Informs object that data was read into buffer.

Parameters:

handle buffer's number.

length amount of data.

offset offset in stream, file, etc.

3.2.3.23 bool DataBufferPar::is_written (char * *buf*)

Informs object that data was written from buffer.

Parameters:

buf - address of buffer

3.2.3.24 bool DataBufferPar::is_written (int *handle*)

Informs object that data was written from buffer.

Parameters:

handle buffer's number.

3.2.3.25 DataBufferPar::operator bool (void) [inline]

Check if DataBufferPar object is initialized.

3.2.3.26]

char* DataBufferPar::operator[] (int *n*)

Direct access to buffer by number.

3.2.3.27 bool DataBufferPar::set (Checksum * *cksum* = NULL, unsigned int *size* = 65536, int *blocks* = 3)

Reinitialize buffers with different parameters.

Parameters:

size size of every buffer in bytes.

blocks number of buffers.

cksum object which will compute checksum. Should not be destroyed till DataBufferPar itself.

3.2.3.28 bool DataBufferPar::wait (void)

Wait (max 60 sec.) till any action happens in object. Returns true if action is eof on any side.

3.2.3.29 bool DataBufferPar::wait_eof (void)

Wait till end of transfer happens on any side.

3.2.3.30 bool DataBufferPar::wait_eof_read (void)

Wait till end of transfer happens on 'read' side.

3.2.3.31 bool DataBufferPar::wait_eof_write (void)

Wait till end of transfer happens on 'write' side.

3.2.3.32 bool DataBufferPar::wait_read (void)

Wait till end of transfer or error happens on 'read' side.

3.2.3.33 bool DataBufferPar::wait_used (void)

Wait till there are no more used buffers left in object.

3.2.3.34 bool DataBufferPar::wait_write (void)

Wait till end of transfer or error happens on 'write' side.

3.2.4 Member Data Documentation**3.2.4.1 [DataSpeed DataBufferPar::speed](#)**

This object controls transfer speed.

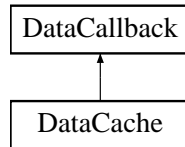

The documentation for this class was generated from the following file:

- databufferpar.h

3.3 DataCache Class Reference

```
#include <datacache.h>
```

Inheritance diagram for DataCache::

Public Types

- enum `file_state_t` { `file_no_error` = 0, `file_download_failed` = 1, `file_not_valid` = 2, `file_keep` = 4 }

Public Member Functions

- time_t `created` (void)
- bool `validtill_available` (void)
- time_t `validtill` (void)
- void `validtill_force` (time_t val)
- void `validtill` (time_t val)

3.3.1 Detailed Description

High level interface to cache operations (same functionality :)) and additional functionality to integrate into grid-manager environment.

3.3.2 Constructor & Destructor Documentation

3.3.2.1 DataCache::DataCache (void)

Default constructor (non-functional cache).

3.3.2.2 DataCache::DataCache (const char * *cache_path*, const char * *cache_data_path*, const char * *cache_link_path*, const char * *id*, uid_t *cache_uid*, gid_t *cache_gid*)

Constructor

Parameters:

cache_path path to directory with cache info files

cache_data_path path to directory with cache data files

cache_link_path path used to create link in case *cache_directory* is visible under different name during actual usage

id identifier used to claim files in cache

cache_uid owner of cahce (0 for public cache)

cache_gid owner group of cache (0 for public cache)

3.3.2.3 DataCache::DataCache (const DataCache & *cache*)

Copy constructor.

3.3.2.4 DataCache::~~DataCache (void)

and destructor

3.3.3 Member Function Documentation

3.3.3.1 virtual bool DataCache::cb (unsigned long long int *size*) [virtual]

Callback implementation to clean at least 1 byte.

Reimplemented from [DataCallback](#).

3.3.3.2 bool DataCache::clean (unsigned long long int *size* = 1)

Remove some amount of oldest information from cache. Returns true on success.

Parameters:

size amount to be removed (bytes)

3.3.3.3 bool DataCache::copy (const char * *link_path*)

Do same as [link\(\)](#) but always create copy.

3.3.3.4 time_t DataCache::created (void) [inline]

Get creation time.

3.3.3.5 void DataCache::created (time_t val) [inline]

Set creation time (if not already set).

Parameters:

val creation time

3.3.3.6 bool DataCache::created_available (void) [inline]

Check if there is an information about creation time.

3.3.3.7 void DataCache::created_force (time_t val) [inline]

Set creation time (even if already set).

Parameters:

val creation time

3.3.3.8 const std::string& DataCache::file (void) const [inline]

Returns path to file which contains/will contain content of assigned url.

3.3.3.9 bool DataCache::link (const char * *link_path*, uid_t *uid*, gid_t *gid*)**Parameters:**

uid set owner of soft-link to uid

gid set group of soft-link to gid

3.3.3.10 bool DataCache::link (const char * *link_path*)

Must be called to create soft-link to cache file or to copy it. It's behavior depends on configuration. All necessary directories will be created. Returns false on error (usually that means soft-link already exists).

Parameters:

link_path path for soft-link or new file.

3.3.3.11 DataCache::operator bool (void) [inline]

Returns true if object is useable.

3.3.3.12 bool DataCache::start (const char * *base_url*, bool & *available*)

Prepare cache for downloading file. On success returns true. This function can block for long time if there is another process downloading same url.

Parameters:

base_url url to assign to file in cache (file's identifier)
available contains true on exit if file is already in cache

3.3.3.13 bool DataCache::stop (int *file_state* = *file_no_error*)

This method must be called after file was downloaded or download failed.

Parameters:

failure true if download failed

3.3.3.14 void DataCache::validtill (time_t *val*) [inline]

Get invalidation time.

3.3.3.15 time_t DataCache::validtill (void) [inline]

Set invalidation time (if not already set).

Parameters:

val validity time

3.3.3.16 bool DataCache::validtill_available (void) [inline]

Check if there is an information about invalidation time.

3.3.3.17 void DataCache::validtill_force (time_t *val*) [inline]

Set invalidation time (even if already set).

Parameters:

val validity time

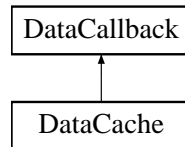

The documentation for this class was generated from the following file:

- datacache.h

3.4 DataCallback Class Reference

```
#include <datacallback.h>
```

Inheritance diagram for DataCallback::

Public Member Functions

- virtual bool **cb** (int)
- virtual bool **cb** (unsigned int)
- virtual bool **cb** (long long int)
- virtual bool **cb** (unsigned long long int)

3.4.1 Detailed Description

This class is used by [DataHandle](#) to report missing space on local filesystem. One of 'cb' functions here will be called if operation initiated by [DataHandle::start_reading](#) runs out of disk space.

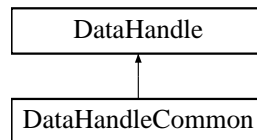

The documentation for this class was generated from the following file:

- datacallback.h

3.5 DataHandle Class Reference

```
#include <datahandle.h>
```

Inheritance diagram for DataHandle::

Static Public Member Functions

- bool [AddProtocol](#) ([constructor_t](#) constructor)
- [DataHandle](#) * **CreateInstance** ([DataPoint](#) *url_)

Protected Member Functions

- virtual bool **init_handle** (void)
- virtual bool **deinit_handle** (void)

3.5.1 Detailed Description

DataHandle is kind of generalized file handle. Differently from file handle it does not support operations read() and write(). Instead it initiates operation and uses object of class [DataBufferPar](#) to pass actual data. It also provides other operations like querying parameters of remote object. It is used by higher-level classes [DataMove](#) and [DataMovePar](#) to provide data transfer service for application.

3.5.2 Member Enumeration Documentation

3.5.2.1 enum [DataHandle::failure_reason_t](#)

Reason of transfer failure.

3.5.3 Constructor & Destructor Documentation

3.5.3.1 DataHandle::DataHandle ([DataPoint](#) * *url_*)

Constructor

Parameters:

url_ URL. Should not be destroyed before DataHandle itself.

3.5.3.2 virtual DataHandle::~~[DataHandle](#) (void) [virtual]

Destructor. No comments.

3.5.4 Member Function Documentation

3.5.4.1 virtual bool DataHandle::additional_checks (void) [virtual]

Check if additional checks before 'reading' and 'writing' will be performed.

3.5.4.2 virtual void DataHandle::additional_checks (bool *v*) [virtual]

Allow/disallow to make check for existence of remote file (and probably other checks too) before initiating 'reading' and 'writing' operations.

Parameters:

v true if allowed (default is true).

3.5.4.3 bool DataHandle::AddProtocol (constructor_t *constructor*) [static]

Register new protocol. Any new instance of DataHandle will recognize it.

3.5.4.4 virtual bool DataHandle::analyze (analyze_t & arg) [virtual]

Analyze url and provide hints.

Parameters:

arg returns suggested values.

3.5.4.5 virtual bool DataHandle::check (void) [virtual]

Query remote server or local file system to check if object is accessible. If possible this function will also try to fill meta information about object in associated [DataPoint](#).

3.5.4.6 virtual failure_reason_t DataHandle::failure_reason (void) [virtual]

Returns reason of transfer failure.

3.5.4.7 virtual bool DataHandle::list_files (std::list< DataPoint::FileInfo > & files, bool resolve = true) [virtual]

List files in directory or service (URL must point to directory/group/service access point).

Parameters:

files will contain list of file names and optionally their attributes.

resolve if false no information about attributes will be retrieved.

3.5.4.8 virtual void DataHandle::out_of_order (bool v) [virtual]

Allow/disallow DataHandle to produce scattered data during 'reading' operation.

Parameters:

v true if allowed.

3.5.4.9 virtual bool DataHandle::out_of_order (void) [virtual]

Returns true if URL can accept scattered data (like arbitrary access to local file) for 'writing' operation.

3.5.4.10 virtual void DataHandle::passive (bool v) [virtual]

Request passive transfers for FTP-like protocols.

Parameters:

true to request.

3.5.4.11 virtual void DataHandle::range (unsigned long long int start = 0, unsigned long long int end = 0) [virtual]

Set range of bytes to retrieve. Default values correspond to whole file.

3.5.4.12 virtual bool DataHandle::remove (void) [virtual]

Remove/delete object at URL.

3.5.4.13 virtual bool DataHandle::secure (void) [virtual]

Check if heavy security during data transfer is allowed.

3.5.4.14 virtual void DataHandle::secure (bool v) [virtual]

Allow/disallow heavy security during data transfer.

Parameters:

v true if allowed (default is true only for gsiftp://).

3.5.4.15 virtual bool DataHandle::start_reading (DataBufferPar & *buffer*) [virtual]

Start reading data from URL. Separate thread to transfer data will be created. No other operation can be performed while 'reading' is in progress.

Parameters:

buffer operation will use this buffer to put information into. Should not be destroyed before stop_reading was called and returned. Returns true on success.

3.5.4.16 virtual bool DataHandle::start_writing (DataBufferPar & *buffer*, DataCallback * *space_cb* = NULL) [virtual]

Start writing data to URL. Separate thread to transfer data will be created. No other operation can be performed while 'writing' is in progress.

Parameters:

buffer operation will use this buffer to get information from. Should not be destroyed before stop_writing was called and returned. *space_cb* callback which is called if there is not enough to space storing data. Currently implemented only for [file:///](#) URL. Returns true on success.

3.5.4.17 virtual bool DataHandle::stop_reading (void) [virtual]

Stop reading. It MUST be called after corresponding start_reading method. Either after whole data is transferred or to cancel transfer. Use 'buffer' object to find out when data is transferred.

3.5.4.18 virtual bool DataHandle::stop_writing (void) [virtual]

Same as stop_reading but for corresponding start_writing.

The documentation for this class was generated from the following file:

- datahandle.h

3.6 DataHandle::analyze_t Class Reference

```
#include <datahandle.h>
```

Public Attributes

- long int **bufsize**
- int **bufnum**
- bool **cache**
- bool **local**
- bool **readonly**

3.6.1 Detailed Description

Structure used in [analyze\(\)](#) call.

Parameters:

- bufsize* returns suggested size of buffers to store data.
- bufnum* returns suggested number of buffers.
- cache* returns true if url is allowed to be cached.
- local* return true if URL is accessed locally ([file://](#))

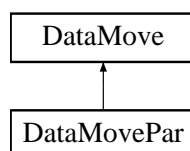

The documentation for this class was generated from the following file:

- datahandle.h

3.7 DataMove Class Reference

```
#include <datamove.h>
```

Inheritance diagram for DataMove::

Public Types

- typedef void(* **callback**)(DataMove *, DataMove::result, const char *, void *)
- enum **result** {
 success = 0, **read_acquire_error** = 1, **write_acquire_error** = 2, **read_resolve_error** = 3,

Static Public Member Functions

- `const char * get_result_string (result r)`

3.7.1 Detailed Description

A purpose of this class is to provide interface moves data between 2 locations specified by URLs. It's main action is represented by methods [DataMove::Transfer](#). Instance represents only attributes used during transfer.

3.7.2 Member Enumeration Documentation

3.7.2.1 enum [DataMove::result](#)

Error code/failure reason.

Enumeration values:

- success* Operation completed successfully.
- read_acquire_error* Source is bad URL or can't be used due to some reason.
- write_acquire_error* Destination is bad URL or can't be used due to some reason.
- read_resolve_error* Resolving of meta-URL for source failed.
- write_resolve_error* Resolving of meta-URL for destination failed.
- preregister_error* First stage of registration of meta-URL failed.
- read_start_error* Can't read from source.
- write_start_error* Can't write to destination.
- read_error* Failed while reading from source.
- write_error* Failed while writing to destination.
- transfer_error* Failed while transferring data (mostly timeout).
- read_stop_error* Failed while finishing reading from source.
- write_stop_error* Failed while finishing writing to destination.
- postregister_error* Last stage of registration of meta-URL failed.
- cache_error* Error in caching procedure.

- credentials_expired_error* Error due to provided credentials are expired.
- undefined_error* Unknown/undefined error.

3.7.3 Constructor & Destructor Documentation

3.7.3.1 [DataMove::DataMove](#) (void)

Constructor.

3.7.3.2 [DataMove::~~DataMove](#) (void)

Destructor.

3.7.4 Member Function Documentation

3.7.4.1 void DataMove::checks (bool *v*)

Set if to make check for existance of remote file (and probably other checks too) before initiating 'reading' and 'writing' operations.

Parameters:

v true if allowed (default is true).

3.7.4.2 bool DataMove::checks (void)

Check if check for existance of remote file is done before initiating 'reading' and 'writing' operations.

3.7.4.3 void DataMove::force_to_meta (bool)

Set if file should be transfered and registered even if such LFN is already registered and source is not one of registered locations.

3.7.4.4 void DataMove::passive (bool)

Set if passive transfer should be used for FTP-like transfers.

3.7.4.5 void DataMove::retry (bool)

Set if transfer will be retried in case of failure.

3.7.4.6 bool DataMove::retry (void)

Check if transfer will be retried in case of failure.

3.7.4.7 void DataMove::secure (bool)

Set if high level of security (encryption) will be used during transfer if available.

3.7.4.8 void DataMove::set_default_max_inactivity_time (time_t *max_inactivity_time*) [inline]

Set maximal allowed time for waiting for any data. For more information see description of [DataSpeed](#) class.

3.7.4.9 void DataMove::set_default_min_average_speed (unsigned long long int *min_average_speed*) [inline]

Set minimal allowed average transfer speed (default is 0 averaged over whole time of transfer. For more information see description of [DataSpeed](#) class.

3.7.4.10 void DataMove::set_default_min_speed (unsigned long long int *min_speed*, time_t *min_speed_time*) [inline]

Set minimal allowed transfer speed (default is 0) to '*min_speed*'. If speed drops below for time longer than '*min_speed_time*' error is raised. For more information see description of [DataSpeed](#) class.

3.7.4.11 result DataMove::Transfer ([DataPoint](#) & *source*, [DataPoint](#) & *destination*, [DataCache](#) & *cache*, const [UrlMap](#) & *map*, unsigned long long int *min_speed*, time_t *min_speed_time*, unsigned long long int *min_average_speed*, time_t *max_inactivity_time*, std::string * *failure_description* = NULL, callback *cb* = NULL, void * *arg* = NULL, const char * *prefix* = NULL)

Initiates transfer from '*source*' to '*destination*'.

Parameters:

min_speed minimal allowed current speed.

min_speed_time time for which speed should be less than '*min_speed*' before transfer fails.

min_average_speed minimal allowed average speed.

max_inactivity_time time for which should be no activity before transfer fails.

3.7.4.12 result DataMove::Transfer ([DataPoint](#) & *source*, [DataPoint](#) & *destination*, [DataCache](#) & *cache*, const [UrlMap](#) & *map*, std::string * *failure_description* = NULL, callback *cb* = NULL, void * *arg* = NULL, const char * *prefix* = NULL)

Initiates transfer from '*source*' to '*destination*'.

Parameters:

source source URL.

destination destination URL.

cache controls caching of downloaded files (if destination url is "file:///"). If caching is not needed default constructor [DataCache\(\)](#) can be used.

map URL mapping/conversion table (for '*source*' URL).

cb if not NULL, transfer is done in separate thread and '*cb*' is called after transfer completes/fails.

arg passed to '*cb*'.

prefix if '*verbose*' is activated this information will be printed before each line representing current transfer status.

3.7.4.13 void DataMove::verbose (const std::string & *prefix*)

Activate printing information about transfer status.

Parameters:

prefix use this string if '*prefix*' in [DataMove::Transfer](#) is NULL.

3.7.4.14 void DataMove::verbose (bool)

Activate printing information about transfer status.

3.7.4.15 bool DataMove::verbose (void)

Check if printing information about transfer status is activated.

The documentation for this class was generated from the following file:

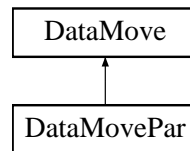

- datamove.h

3.8 DataMovePar Class Reference

Wrapper around [DataMove](#) class to handle few transfers at once.

```
#include <datamovepar.h>
```

Inheritance diagram for DataMovePar::

Public Member Functions

- [DataMovePar](#) (void)
- [~DataMovePar](#) (void)
- bool [Add](#) (const char *source_url, const char *destination_url)
- bool [Get](#) (std::string &source_url, std::string &destination_url, [result](#) &res)
- bool [Transfer](#) (int num=5)
- bool [Transfer](#) ([DataCache](#) cache, const UrlMap &map, int num=5)

3.8.1 Detailed Description

Wrapper around [DataMove](#) class to handle few transfers at once.

3.8.2 Constructor & Destructor Documentation

3.8.2.1 DataMovePar::DataMovePar (void)

Constructor.

3.8.2.2 DataMovePar::~~DataMovePar (void)

Destructor. Object can't be destroyed while there is any transfer in progress.

3.8.3 Member Function Documentation

3.8.3.1 bool DataMovePar::Add (const char * source_url, const char * destination_url)

Add one more source and destination pair to list of handled transfers.

Parameters:

source_url URL (or meta-URL) of source file

destination_url URL (or meta-URL) of destination file

3.8.3.2 **bool DataMovePar::Get** (std::string & *source_url*, std::string & *destination_url*, **result** & *res*)

Get source and destination pair from list with result of transfer

Parameters:

source_url on exit contains URL (or meta-URL) of source file

destination_url on exit contains URL (or meta-URL) of destination file

res result of operation

3.8.3.3 **bool DataMovePar::Transfer** (**DataCache** *cache*, const UrlMap & *map*, int *num* = 5)

Perform transfer

Parameters:

cache to control data caching (use default constructor for no caching)

map to change/map source URLs (use default constructor for no mapping)

num number of simultaneous transfers

3.8.3.4 **bool DataMovePar::Transfer** (int *num* = 5)

Perform transfer

Parameters:

num number of simultaneous transfers

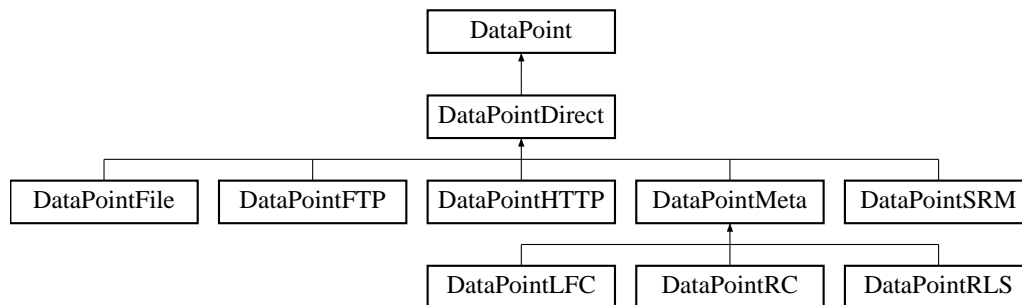

The documentation for this class was generated from the following file:

- datamovepar.h

3.9.1 Detailed Description

[DataPoint](#) is an abstraction of URL. It can handle URLs of type [file://](#), [ftp://](#), [gsiftp://](#), [http://](#), [https://](#), [httpg://](#) (HTTP over GSI), [se://](#) (NG web service over HTTPG) and meta-URLs (URLs of Infexing Services) [rc://](#), [rls://](#). [DataPoint](#) provides means to resolve meta-URL into multiple URLs and to loop through them. [DataPoint](#) is both base virtual class and wrapper. It's implementation provides only redirection methods and type definitions.

3.9.2 Constructor & Destructor Documentation

3.9.2.1 [DataPoint::DataPoint](#) (const char * *url*)

Constructor requires URL or meta-URL to be provided.

3.9.3 Member Function Documentation

3.9.3.1 virtual bool DataPoint::accepts_meta (void) [virtual]

If endpoint can have any use from meta information.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.2 virtual bool DataPoint::add_location (const char * meta, const char * loc) [virtual]

Add URL to list.

Parameters:

meta meta-name (name of location/service).

loc URL.

Reimplemented in [DataPointDirect](#).

3.9.3.3 bool DataPoint::AddProtocol (constructor_t constructor) [static]

Register new protocol. Any new instance of DataPoint will recognize it.

3.9.3.4 virtual std::string DataPoint::base_url (void) const [virtual]

Returns URL which was passed to constructor.

Reimplemented in [DataPointDirect](#).

3.9.3.5 virtual std::string DataPoint::canonic_url (void) const [virtual]

Returns URL which was passed to constructor with location names and options removed, port number added.

Reimplemented in [DataPointDirect](#).

3.9.3.6 virtual const char* DataPoint::current_location (void) const [virtual]

Returns current (resolved) URL.

Reimplemented in [DataPointDirect](#).

3.9.3.7 virtual const char* DataPoint::current_meta_location (void) const [virtual]

Returns meta information used to create curent URL. For RC that is location's name. For RLS that is equal to pfn.

Reimplemented in [DataPointDirect](#).

3.9.3.8 virtual bool DataPoint::get_info (DataPoint::FileInfo & fi) [virtual]

Retrieve properties of object pointed by meta-URL of DataPoint object. It works only for meta-URL.

Parameters:

fi contains retrieved information.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.9 virtual bool DataPoint::have_location (void) const [virtual]

Returns false if out of retries.

Reimplemented in [DataPointDirect](#).

3.9.3.10 virtual bool DataPoint::have_locations (void) const [virtual]

Returns true if number of resolved URLs is not 0.

Reimplemented in [DataPointDirect](#).

3.9.3.11 virtual const char* DataPoint::lfn (void) const [virtual]

Returns name which is given to file in Indexing Service (aka LFN).

Reimplemented in [DataPointMeta](#).

3.9.3.12 virtual bool DataPoint::list_files (std::list< [DataPoint::FileInfo](#) > &files, bool resolve = true) [virtual]

Obtain information about objects and their properties available under meta-URL of DataPoint object. It works only for meta-URL.

Parameters:

files list of obtained objects.

resolve if false, do not try to obtain properties of objects.

Reimplemented in [DataPointDirect](#).

3.9.3.13 virtual bool DataPoint::local (void) const [virtual]

Check if file is local (URL is something like [file://](#)).

Reimplemented in [DataPointDirect](#).

3.9.3.14 virtual bool DataPoint::map (const UrlMap &maps) [virtual]

Map url (change it) according to table provided in maps.

Parameters:

maps mapping information.

Reimplemented in [DataPointDirect](#).

3.9.3.15 virtual void DataPoint::meta (const [DataPoint](#) & *p*) [virtual]

Acquire meta-information from another object. Defined values are not overwritten.

Parameters:

p object from which information is taken.

Reimplemented in [DataPointDirect](#).

3.9.3.16 virtual bool DataPoint::meta (void) const [virtual]

Check if URL is meta-URL.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.17 virtual const char* DataPoint::meta_checksum (void) const [virtual]

Get value of meta-information 'checksum'.

Reimplemented in [DataPointDirect](#).

3.9.3.18 virtual void DataPoint::meta_checksum (const char * *val*) [virtual]

Set value of meta-information 'checksum' if not already set.

Reimplemented in [DataPointDirect](#).

3.9.3.19 virtual bool DataPoint::meta_checksum_available (void) const [virtual]

Check if meta-information 'checksum' is available.

Reimplemented in [DataPointDirect](#).

3.9.3.20 virtual void DataPoint::meta_checksum_force (const char * *val*) [virtual]

Set value of meta-information 'checksum'.

Reimplemented in [DataPointDirect](#).

3.9.3.21 virtual bool DataPoint::meta_compare (const [DataPoint](#) & *p*) const [virtual]

are not used for comparison. Default result is 'true'.

Parameters:

p object to which compare.

Reimplemented in [DataPointDirect](#).

3.9.3.22 virtual time_t DataPoint::meta_created (void) const [virtual]

Get value of meta-information 'creation/modification time'.

Reimplemented in [DataPointDirect](#).

3.9.3.23 virtual void DataPoint::meta_created (time_t val) [virtual]

Set value of meta-information 'creation/modification time' if not already set.

Reimplemented in [DataPointDirect](#).

3.9.3.24 virtual bool DataPoint::meta_created_available (void) const [virtual]

Check if meta-information 'creation/modification time' is available.

Reimplemented in [DataPointDirect](#).

3.9.3.25 virtual void DataPoint::meta_created_force (time_t val) [virtual]

Set value of meta-information 'creation/modification time'.

Reimplemented in [DataPointDirect](#).

3.9.3.26 virtual bool DataPoint::meta_postregister (bool replication, bool failure) [virtual]

Used for same purpose as meta_preregister. Should be called after actual transfer of file successfully finished.

Parameters:

replication if true then file is being replicated between 2 locations registered in Indexing Service under same name.

failure not used.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.27 virtual bool DataPoint::meta_preregister (bool replication, bool force = false) [virtual]

This function registers physical location of file into Indexing Service. It should be called *before* actual transfer to that location happens.

Parameters:

replication if true then file is being replicated between 2 locations registered in Indexing Service under same name.

force if true, perform registration of new file even if it already exists. Should be used to fix failures in Indexing Service.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.28 virtual bool DataPoint::meta_preunregister (bool replication) [virtual]

Should be called if file transfer failed. It removes changes made by meta_preregister.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.29 virtual bool DataPoint::meta_resolve (bool *source*, const UrlMap & *maps*) [virtual]

Resolve meta-URL into list of ordinary URLs and obtain meta-information about file. Also sort obtained list so that URLs mentioned in UrlMap object are placed first. This is used during transfer to access local locations first.

Parameters:

maps list of mappings of remote URLs to (potentially) local locations.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.30 virtual bool DataPoint::meta_resolve (bool *source*) [virtual]

Resolve meta-URL into list of ordinary URLs and obtain meta-information about file. Can be called for object representing ordinary URL or already resolved object.

Parameters:

source true if DataPoint object represents source of information

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.31 virtual unsigned long long int DataPoint::meta_size (void) const [virtual]

Get value of meta-information 'size'.

Reimplemented in [DataPointDirect](#).

3.9.3.32 virtual void DataPoint::meta_size (unsigned long long int *val*) [virtual]

Set value of meta-information 'size' if not already set.

Reimplemented in [DataPointDirect](#).

3.9.3.33 virtual bool DataPoint::meta_size_available (void) const [virtual]

Check if meta-information 'size' is available.

Reimplemented in [DataPointDirect](#).

3.9.3.34 virtual void DataPoint::meta_size_force (unsigned long long int *val*) [virtual]

Set value of meta-information 'size'.

Reimplemented in [DataPointDirect](#).

3.9.3.35 virtual bool DataPoint::meta_stored (void) [virtual]

Check if file is registered in Indexing Service. Proper value is obtainable only after meta-resolve.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.36 virtual bool DataPoint::meta_unregister (bool *all*) [virtual]

Remove information about file registered in Indexing Service.

Parameters:

all if true information about file itself is (LFN) is removed. Otherwise only particular physical instance is unregistered.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.37 virtual time_t DataPoint::meta_validtill (void) const [virtual]

Get value of meta-information 'validity time'.

Reimplemented in [DataPointDirect](#).

3.9.3.38 virtual void DataPoint::meta_validtill (time_t *val*) [virtual]

Set value of meta-information 'validity time' if not already set.

Reimplemented in [DataPointDirect](#).

3.9.3.39 virtual bool DataPoint::meta_validtill_available (void) const [virtual]

Check if meta-information 'validity time' is available.

Reimplemented in [DataPointDirect](#).

3.9.3.40 virtual void DataPoint::meta_validtill_force (time_t *val*) [virtual]

Set value of meta-information 'validity time'.

Reimplemented in [DataPointDirect](#).

3.9.3.41 virtual bool DataPoint::next_location (void) [virtual]

Switch to next location in list of URLs. At last location switch to first if number of allowed retries does not exceeded. Returns false if no retries left.

Reimplemented in [DataPointDirect](#).

3.9.3.42 virtual bool DataPoint::provides_meta (void) [virtual]

If endpoint can provide at least some meta information directly.

Reimplemented in [DataPointDirect](#), and [DataPointMeta](#).

3.9.3.43 virtual bool DataPoint::remove_location (void) [virtual]

Remove current URL from list.

Reimplemented in [DataPointDirect](#).

3.9.3.44 virtual bool DataPoint::remove_locations (const [DataPoint](#) & *p*) [virtual]

Remove locations present in another DataPoint object.

Reimplemented in [DataPointDirect](#).

3.9.3.45 virtual bool DataPoint::sort (const UrlMap & *maps*) [virtual]

Sort list of URLs so that those listed in mapping table are put first. It can also implement any other algorithm too.

Parameters:

maps mapping information.

Reimplemented in [DataPointDirect](#).

3.9.3.46 virtual void DataPoint::tries (int *n*) [virtual]

Set number of retries.

Reimplemented in [DataPointDirect](#).

3.9.3.47 virtual int DataPoint::tries (void) [virtual]

Returns number of retries left.

Reimplemented in [DataPointDirect](#).

The documentation for this class was generated from the following file:

- [datapoint.h](#)

3.10 DataPoint::FileInfo Class Reference

```
#include <datapoint.h>
```

Public Types

- enum **Type** { **file_type_unknown** = 0, **file_type_file** = 1, **file_type_dir** = 2 }

3.10.1 Detailed Description

FileInfo stores information about file (meta-information). Although all members are public it is not desirable to modify them directly outside **DataPoint** class.

3.10.2 Constructor & Destructor Documentation

3.10.2.1 DataPoint::FileInfo::FileInfo (const char * name_ = "") [inline]

Fyle type - usually file_type_file - ordinary file.

3.10.3 Member Data Documentation

3.10.3.1 std::string DataPoint::FileInfo::checksum

If size is known.

3.10.3.2 bool DataPoint::FileInfo::checksum_available

Checksum of file.

3.10.3.3 `time_t DataPoint::FileInfo::created`

If checksum is known.

3.10.3.4 `bool DataPoint::FileInfo::created_available`

Creation/modification time.

3.10.3.5 `unsigned long long int DataPoint::FileInfo::size`

Physical endpoints/URLs at which file can be accessed.

3.10.3.6 `bool DataPoint::FileInfo::size_available`

Size of file in bytes.

3.10.3.7 `Type DataPoint::FileInfo::type`

If validity is known.

3.10.3.8 `time_t DataPoint::FileInfo::valid`

If time is known.

3.10.3.9 `bool DataPoint::FileInfo::valid_available`

Valid till time.

3.11.1 Detailed Description

DataPointDirect implements common purpose private attributes and corresponding methods suitable for any kind of URL. It should never be used directly.

3.11.2 Member Function Documentation

3.11.2.1 virtual bool DataPointDirect::accepts_meta (void) [inline, virtual]

If endpoint can have any use from meta information.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.2 virtual bool DataPointDirect::add_location (const char * *meta*, const char * *loc*)
[virtual]

Add URL to list.

Parameters:

meta meta-name (name of location/service).

loc URL.

Reimplemented from [DataPoint](#).

3.11.2.3 virtual std::string DataPointDirect::base_url (void) const [virtual]

Returns URL which was passed to constructor.

Reimplemented from [DataPoint](#).

3.11.2.4 virtual std::string DataPointDirect::canonic_url (void) const [virtual]

Returns URL which was passed to constructor with location names and options removed, port number added.

Reimplemented from [DataPoint](#).

3.11.2.5 virtual const char* DataPointDirect::current_location (void) const [inline, virtual]

Returns current (resolved) URL.

Reimplemented from [DataPoint](#).

3.11.2.6 virtual const char* DataPointDirect::current_meta_location (void) const [inline, virtual]

Returns meta information used to create curent URL. For RC that is location's name. For RLS that is equal to pfn.

Reimplemented from [DataPoint](#).

3.11.2.7 virtual bool DataPointDirect::get_info ([DataPoint::FileInfo](#) & *fi*) [inline, virtual]

Retrieve properties of object pointed by meta-URL of [DataPoint](#) object. It works only for meta-URL.

Parameters:

fi contains retrieved information.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.8 virtual bool DataPointDirect::have_location (void) const [virtual]

Returns false if out of retries.

Reimplemented from [DataPoint](#).

3.11.2.9 virtual bool DataPointDirect::have_locations (void) const [virtual]

Returns true if number of resolved URLs is not 0.

Reimplemented from [DataPoint](#).

3.11.2.10 virtual bool DataPointDirect::list_files (std::list< [DataPoint::FileInfo](#) > &files, bool resolve = true) [inline, virtual]

Obtain information about objects and their properties available under meta-URL of [DataPoint](#) object. It works only for meta-URL.

Parameters:

files list of obtained objects.

resolve if false, do not try to obtain properties of objects.

Reimplemented from [DataPoint](#).

3.11.2.11 virtual bool DataPointDirect::local (void) const [inline, virtual]

Check if file is local (URL is something like `file://`).

Reimplemented from [DataPoint](#).

3.11.2.12 virtual bool DataPointDirect::map (const UrlMap &maps) [virtual]

Map url (change it) according to table provided in maps.

Parameters:

maps mapping information.

Reimplemented from [DataPoint](#).

3.11.2.13 virtual bool DataPointDirect::meta (void) const [inline, virtual]

Check if URL is meta-URL.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.14 virtual void DataPointDirect::meta (const [DataPoint](#) &p) [inline, virtual]

Acquire meta-information from another object. Defined values are not overwritten.

Parameters:

p object from which information is taken.

Reimplemented from [DataPoint](#).

3.11.2.15 virtual const char* DataPointDirect::meta_checksum (void) const [inline, virtual]

Get value of meta-information 'checksum'.

Reimplemented from [DataPoint](#).

3.11.2.16 virtual void DataPointDirect::meta_checksum (const char * val) [inline, virtual]

Set value of meta-information 'checksum' if not already set.

Reimplemented from [DataPoint](#).

3.11.2.17 virtual bool DataPointDirect::meta_checksum_available (void) const [inline, virtual]

Check if meta-information 'checksum' is available.

Reimplemented from [DataPoint](#).

3.11.2.18 virtual void DataPointDirect::meta_checksum_force (const char * val) [inline, virtual]

Set value of meta-information 'checksum'.

Reimplemented from [DataPoint](#).

3.11.2.19 virtual bool DataPointDirect::meta_compare (const [DataPoint](#) & p) const [inline, virtual]

are not used for comparison. Default result is 'true'.

Parameters:

p object to which compare.

Reimplemented from [DataPoint](#).

3.11.2.20 virtual time_t DataPointDirect::meta_created (void) const [inline, virtual]

Get value of meta-information 'creation/modification time'.

Reimplemented from [DataPoint](#).

3.11.2.21 virtual void DataPointDirect::meta_created (time_t val) [inline, virtual]

Set value of meta-information 'creation/modification time' if not already set.

Reimplemented from [DataPoint](#).

3.11.2.22 virtual bool DataPointDirect::meta_created_available (void) const [inline, virtual]

Check if meta-information 'creation/modification time' is available.

Reimplemented from [DataPoint](#).

3.11.2.23 virtual void DataPointDirect::meta_created_force (time_t val) [inline, virtual]

Set value of meta-information 'creation/modification time'.

Reimplemented from [DataPoint](#).

3.11.2.24 virtual bool DataPointDirect::meta_postregister (bool replication, bool failure) [inline, virtual]

Used for same purpose as meta_preregister. Should be called after actual transfer of file successfully finished.

Parameters:

replication if true then file is being replicated between 2 locations registered in Indexing Service under same name.

failure not used.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.25 virtual bool DataPointDirect::meta_preregister (bool replication, bool force = false) [inline, virtual]

This function registers physical location of file into Indexing Service. It should be called *before* actual transfer to that location happens.

Parameters:

replication if true then file is being replicated between 2 locations registered in Indexing Service under same name.

force if true, perform registration of new file even if it already exists. Should be used to fix failures in Indexing Service.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.26 virtual bool DataPointDirect::meta_preunregister (bool replication) [inline, virtual]

Should be called if file transfer failed. It removes changes made by meta_preregister.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.27 virtual bool DataPointDirect::meta_resolve (bool source, const UrlMap & maps) [inline, virtual]

Resolve meta-URL into list of ordinary URLs and obtain meta-information about file. Also sort obtained list so that URLs mentioned in UrlMap object are placed first. This is used during transfer to access local locations first.

Parameters:

maps list of mappings of remote URLs to (potentially) local locations.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.28 virtual bool DataPointDirect::meta_resolve (bool *source*) [inline, virtual]

Resolve meta-URL into list of ordinary URLs and obtain meta-information about file. Can be called for object representing ordinary URL or already resolved object.

Parameters:

source true if [DataPoint](#) object represents source of information

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.29 virtual unsigned long long int DataPointDirect::meta_size (void) const [inline, virtual]

Get value of meta-information 'size'.

Reimplemented from [DataPoint](#).

3.11.2.30 virtual void DataPointDirect::meta_size (unsigned long long int *val*) [inline, virtual]

Set value of meta-information 'size' if not already set.

Reimplemented from [DataPoint](#).

3.11.2.31 virtual bool DataPointDirect::meta_size_available (void) const [inline, virtual]

Check if meta-information 'size' is available.

Reimplemented from [DataPoint](#).

3.11.2.32 virtual void DataPointDirect::meta_size_force (unsigned long long int *val*) [inline, virtual]

Set value of meta-information 'size'.

Reimplemented from [DataPoint](#).

3.11.2.33 virtual bool DataPointDirect::meta_stored (void) [inline, virtual]

Check if file is registered in Indexing Service. Proper value is obtainable only after meta-resolve.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.34 virtual bool DataPointDirect::meta_unregister (bool *all*) [inline, virtual]

Remove information about file registered in Indexing Service.

Parameters:

all if true information about file itself is (LFN) is removed. Otherwise only particular physical instance is unregistered.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.35 virtual time_t DataPointDirect::meta_validtill (void) const [inline, virtual]

Get value of meta-information 'validity time'.

Reimplemented from [DataPoint](#).

3.11.2.36 virtual void DataPointDirect::meta_validtill (time_t *val*) [inline, virtual]

Set value of meta-information 'validity time' if not already set.

Reimplemented from [DataPoint](#).

3.11.2.37 virtual bool DataPointDirect::meta_validtill_available (void) const [inline, virtual]

Check if meta-information 'validity time' is available.

Reimplemented from [DataPoint](#).

3.11.2.38 virtual void DataPointDirect::meta_validtill_force (time_t *val*) [inline, virtual]

Set value of meta-information 'validity time'.

Reimplemented from [DataPoint](#).

3.11.2.39 virtual bool DataPointDirect::next_location (void) [virtual]

Switch to next location in list of URLs. At last location switch to first if number of allowed retries does not exceeded. Returns false if no retries left.

Reimplemented from [DataPoint](#).

3.11.2.40 virtual bool DataPointDirect::provides_meta (void) [inline, virtual]

If endpoint can provide at least some meta information directly.

Reimplemented from [DataPoint](#).

Reimplemented in [DataPointMeta](#).

3.11.2.41 virtual bool DataPointDirect::remove_location (void) [virtual]

Remove current URL from list.

Reimplemented from [DataPoint](#).

3.11.2.42 virtual bool DataPointDirect::remove_locations (const [DataPoint](#) & p) [virtual]

Remove locations present in another [DataPoint](#) object.

Reimplemented from [DataPoint](#).

3.11.2.43 virtual bool DataPointDirect::sort (const UrlMap & maps) [virtual]

Sort list of URLs so that those listed in mapping table are put first. It can also implement any other algorithm too.

Parameters:

maps mapping information.

Reimplemented from [DataPoint](#).

3.11.2.44 virtual void DataPointDirect::tries (int n) [virtual]

Set number of retries.

Reimplemented from [DataPoint](#).

3.11.2.45 virtual int DataPointDirect::tries (void) [virtual]

Returns number of retries left.

Reimplemented from [DataPoint](#).

3.11.3 Member Data Documentation

3.11.3.1 std::string [DataPointDirect::common_url_options](#) [protected]

Initial URL.

3.11.3.2 std::list<[Location](#)>::iterator [DataPointDirect::location](#) [protected]

List of locations at which file can be probably found.

3.11.3.3 unsigned long long int [DataPointDirect::meta_size_](#) [protected]

URL options to be added to all derived URLs.

The documentation for this class was generated from the following file:

- datapoint.h

Friends

- class [DataPointDirect](#)

3.12.1 Detailed Description

DataPointDirect::Location represents physical service at which files are located aka "base URL" including it's name (as given in Indexing Service). /// Currently it is used only internally by classes derived from [DataPointDirect](#) class and for printing debug information.

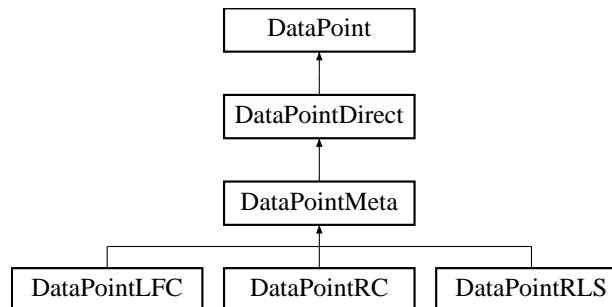

The documentation for this class was generated from the following file:

- datapoint.h

3.13 DataPointMeta Class Reference

3.13.1 Detailed Description

DataPointMeta complements [DataPointDirect](#) with attributes common for meta-URLs. It should never be used directly.

3.13.2 Member Function Documentation

3.13.2.1 `virtual bool DataPointMeta::accepts_meta (void)` [inline, virtual]

If endpoint can have any use from meta information.

Reimplemented from [DataPointDirect](#).

3.13.2.2 `virtual bool DataPointMeta::get_info (DataPoint::FileInfo &fi)` [virtual]

Retrieve properties of object pointed by meta-URL of [DataPoint](#) object. It works only for meta-URL.

Parameters:

fi contains retrieved information.

Reimplemented from [DataPointDirect](#).

3.13.2.3 `virtual const char* DataPointMeta::lfn (void) const` [inline, virtual]

Returns name which is given to file in Indexing Service (aka LFN).

Reimplemented from [DataPoint](#).

3.13.2.4 `virtual bool DataPointMeta::meta (void) const` [inline, virtual]

Check if URL is meta-URL.

Reimplemented from [DataPointDirect](#).

3.13.2.5 `virtual bool DataPointMeta::meta_postregister (bool replication, bool failure)` [inline, virtual]

Used for same purpose as meta_preregister. Should be called after actual transfer of file successfully finished.

Parameters:

replication if true then file is being replicated between 2 locations registered in Indexing Service under same name.

failure not used.

Reimplemented from [DataPointDirect](#).

3.13.2.6 `virtual bool DataPointMeta::meta_preregister (bool replication, bool force = false)` [inline, virtual]

This function registers physical location of file into Indexing Service. It should be called *before* actual transfer to that location happens.

Parameters:

replication if true then file is being replicated between 2 locations registered in Indexing Service under same name.

force if true, perform registration of new file even if it already exists. Should be used to fix failures in Indexing Service.

Reimplemented from [DataPointDirect](#).

3.13.2.7 virtual bool DataPointMeta::meta_preunregister (bool *replication*) [inline, virtual]

Should be called if file transfer failed. It removes changes made by meta_preregister.

Reimplemented from [DataPointDirect](#).

3.13.2.8 virtual bool DataPointMeta::meta_resolve (bool *source*, const UrlMap & *maps*) [virtual]

Resolve meta-URL into list of ordinary URLs and obtain meta-information about file. Also sort obtained list so that URLs mentioned in UrlMap object are placed first. This is used during transfer to access local locations first.

Parameters:

maps list of mappings of remote URLs to (potentially) local locations.

Reimplemented from [DataPointDirect](#).

3.13.2.9 virtual bool DataPointMeta::meta_resolve (bool *source*) [inline, virtual]

Resolve meta-URL into list of ordinary URLs and obtain meta-information about file. Can be called for object representing ordinary URL or already resolved object.

Parameters:

source true if [DataPoint](#) object represents source of information

Reimplemented from [DataPointDirect](#).

3.13.2.10 virtual bool DataPointMeta::meta_stored (void) [inline, virtual]

Check if file is registered in Indexing Service. Proper value is obtainable only after meta-resolve.

Reimplemented from [DataPointDirect](#).

3.13.2.11 virtual bool DataPointMeta::meta_unregister (bool *all*) [inline, virtual]

Remove information about file registered in Indexing Service.

Parameters:

all if true information about file itself is (LFN) is removed. Otherwise only particular physical instance is unregistered.

Reimplemented from [DataPointDirect](#).

3.13.2.12 virtual bool DataPointMeta::provides_meta (void) [inline, virtual]

If endpoint can provide at least some meta information directly.

Reimplemented from [DataPointDirect](#).

- bool [max_inactivity_time_failure](#) ()
- unsigned long long int [transferred_size](#) (void)

3.14.1 Detailed Description

Keeps track of average and instantaneous speed. Also detects data transfer inactivity and other transfer timeouts.

3.14.2 Constructor & Destructor Documentation

3.14.2.1 DataSpeed::DataSpeed (time_t *base* = DATASPEED_AVERAGING_PERIOD)

Constructor

Parameters:

base time period used to average values (default 1 minute).

3.14.2.2 DataSpeed::DataSpeed (unsigned long long int *min_speed*, time_t *min_speed_time*, unsigned long long int *min_average_speed*, time_t *max_inactivity_time*, time_t *base* = DATASPEED_AVERAGING_PERIOD)

Constructor

Parameters:

base time period used to average values (default 1 minute).

min_speed minimal allowed speed (Butes per second). If speed drops and holds below threshold for *min_speed_time_* seconds error is triggered.

min_speed_time

min_average_speed_ minimal average speed (Bytes per second) to trigger error. Averaged over whole current transfer time.

max_inactivity_time - if no data is passing for specified amount of time (seconds), error is triggered.

3.14.2.3 DataSpeed::~~DataSpeed (void)

Destructor.

3.14.3 Member Function Documentation

3.14.3.1 void DataSpeed::hold (bool *disable*)

Turn off speed control.

Parameters:

disable true to turn off.

3.14.3.2 bool DataSpeed::max_inactivity_time_failure () [inline]

Check if maximal inactivity time error was triggered.

3.14.3.3 bool DataSpeed::min_average_speed_failure () [inline]

Check if minimal average speed error was triggered.

3.14.3.4 bool DataSpeed::min_speed_failure () [inline]

Check if minimal speed error was triggered.

3.14.3.5 void DataSpeed::reset (void)

Reset all counters and triggers.

3.14.3.6 void DataSpeed::set_base (time_t *base_* = DATASPEED_AVERAGING_PERIOD)

Set averaging time period.

Parameters:

base time period used to average values (default 1 minute).

3.14.3.7 void DataSpeed::set_max_data (unsigned long long int *max* = 0)

Set amount of data to be transfered. Used in verbose messages.

Parameters:

max amount of data in bytes.

3.14.3.8 void DataSpeed::set_max_inactivity_time (time_t *max_inactivity_time*)

Set inactivity tiemout.

Parameters:

max_inactivity_time - if no data is passing for specified amount of time (seconds), error is triggered.

3.14.3.9 void DataSpeed::set_min_average_speed (unsigned long long int *min_average_speed*)

Set minmal avaerage speed.

Parameters:

min_average_speed_ minimal average speed (Bytes per second) to trigger error. Averaged over whole current transfer time.

3.14.3.10 void DataSpeed::set_min_speed (unsigned long long int *min_speed*, time_t *min_speed_time*)

Set minimal allowed speed.

Parameters:

min_speed minimal allowed speed (Butes per second). If speed drops and holds below threshold for *min_speed_time_* seconds error is triggered.

min_speed_time

3.14.3.11 void DataSpeed::set_progress_indicator (show_progress_t *func* = NULL)

Specify which external function will print verbose messages. If not specified internal one is used.

Parameters:

pointer to function which prints information.

3.14.3.12 bool DataSpeed::transfer (unsigned long long int *n* = 0)

Inform object, about amount of data has been transfered. All errors are triggered by this method. To make them work application must call this method periodically even with zero value.

Parameters:

n amount of data transfered (bytes).

3.14.3.13 unsigned long long int DataSpeed::transferred_size (void) [inline]

Returns amount of data this object knows about.

3.14.3.14 bool DataSpeed::verbose (void)

Check if speed information is going to be printed.

3.14.3.15 void DataSpeed::verbose (const std::string & *prefix*)

Print information about current speed and amount of data.

Parameters:

'prefix' add this string at the beginning of every string.

3.14.3.16 void DataSpeed::verbose (bool *val*)

Activate printing information about current time speeds, amount of transfered data.
