Chapter 1

Namespace Index

1.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

Arc (Arc namespace contains all core ARC classes)	19
ArcCredential	45
DataStaging (DataStaging contains all components for data transfer scheduling and execution) .	47

Chapter 2

Data Structure Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

ArcCredential::ACACI	49
ArcCredential::ACATHOLDER	50
ArcCredential::ACATTR	51
ArcCredential::ACATTRIBUTE	52
ArcCredential::ACC	53
ArcCredential::ACCERTS	54
ArcCredential::ACDIGEST	55
ArcCredential::ACFORM	56
ArcCredential::ACFULLATTRIBUTES	57
ArcCredential::ACHOLDER	58
ArcCredential::ACIETFATTR	59
ArcCredential::ACINFO	60
ArcCredential::ACIS	61
ArcCredential::ACSEQ	62

Chapter 3

Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

ArcCredential::ACACI	49
ArcCredential::ACATHOLDER	50
ArcCredential::ACATTR	51
ArcCredential::ACATTRIBUTE	52
ArcCredential::ACC	53
ArcCredential::ACCERTS	54
ArcCredential::ACDIGEST	55
ArcCredential::ACFORM	56
ArcCredential::ACFULLATTRIBUTES	57
ArcCredential::ACHOLDER	58
ArcCredential::ACIETFATTR	59
ArcCredential::ACINFO	60
ArcCredential::ACIS	61
ArcCredential::ACSEQ	62
ArcCredential::ACTARGET	63
ArcCredential::ACTARGETS	64
ArcCredential::ACVAL	65
Arc::Adler32Sum (Implementation of Adler32 checksum)	66
Arc::AdminDomainAttributes	68
Arc::AdminDomainType	69
ArcSec::AlgFactory (Interface for algorithm factory class)	70
ArcSec::AnyURIAttribute	71
Arc::ApplicationEnvironment (ApplicationEnvironment)	72
Arc::ApplicationType	73
Arc::ArcLocation (Determines ARC installation location)	75
ArcSec::ArcPeriod	76
Arc::ARCPolicyHandlerConfig	77
Arc::ArcVersion (Determines ARC HED libraries version)	78
ArcSec::Attr (Attr contains a tuple of attribute type and value)	79
ArcSec::AttributeFactory	80
Arc::AttributeIterator (A const iterator class for accessing multiple values of an attribute)	81
ArcSec::AttributeProxy (Interface for creating the AttributeValue object, it will be used by AttributeFactory)	84

ArcSec::AttributeValue (Interface for containing different type of <Attribute> node for both policy and request)	85
ArcSec::Attrs (Attrs is a container for one or more Attr)	87
ArcSec::AuthzRequest	88
ArcSec::AuthzRequestSection	89
Arc::AutoPointer< T > (Wrapper for pointer with automatic destruction)	90
Arc::Base64	91
Arc::BaseConfig	92
ArcSec::BooleanAttribute	94
Arc::Broker	95
Arc::BrokerPlugin	96
Arc::BrokerPluginArgument	97
Arc::BrokerPluginLoader	98
Arc::BrokerPluginTestACCControl	99
ArcCredential::cert_verify_context	100
Arc::CertEnvLocker	101
Arc::ChainContext (Interface to chain specific functionality)	102
Arc::CheckSum (Interface for checksum manipulations)	103
Arc::CheckSumAny (Wrapper for CheckSum class)	105
Arc::CIStringValue (This class implements case insensitive strings as security attributes)	108
Arc::ClassLoader	110
Arc::ClassLoaderPluginArgument	111
Arc::ClientHTTP (Class for setting up a MCC chain for HTTP communication)	112
Arc::ClientHTTPwithSAML2SSO	113
Arc::ClientInterface (Utility base class for MCC)	114
Arc::ClientSOAP	115
Arc::ClientSOAPwithSAML2SSO	117
Arc::ClientTCP (Class for setting up a MCC chain for TCP communication)	118
Arc::ClientX509Delegation	119
ArcSec::CombiningAlg (Interface for combining algorithm)	121
Arc::EntityRetriever< T >::Common	122
Arc::ComputingEndpointAttributes	123
Arc::ComputingEndpointType	124
Arc::ComputingManagerAttributes	125
Arc::ComputingManagerType	126
Arc::ComputingServiceAttributes	127
Arc::ComputingServiceRetriever	128
Arc::ComputingServiceType	129
Arc::ComputingShareAttributes	130
Arc::ComputingShareType	131
Arc::Config (Configuration element - represents (sub)tree of ARC configuration)	132
Arc::ConfigEndpoint	134
Arc::ConfusaCertHandler	135
Arc::ConfusaParserUtils	136
Arc::CountedBroker	138
Arc::CountedPointer< T > (Wrapper for pointer with automatic destruction and mutiple references)	139
Arc::Counter (A class defining a common interface for counters)	140
Arc::CounterTicket (A class for "tickets" that correspond to counter reservations)	147
Arc::CRC32Sum (Implementation of CRC32 checksum)	149
Arc::Credential	151
Arc::CredentialError	160
Arc::CredentialStore	161
Arc::Database (Interface for calling database client library)	162

DataStaging::DataDelivery (DataDelivery transfers data between specified physical locations)	164
DataStaging::DataDeliveryComm (This class provides an abstract interface for the Delivery layer)	165
DataStaging::DataDeliveryCommHandler (Singleton class handling all active DataDeliveryComm objects)	168
DataStaging::DataDeliveryLocalComm (This class starts, monitors and controls a local Delivery process)	169
DataStaging::DataDeliveryRemoteComm (This class contacts a remote service to make a Delivery request)	170
Arc::DataStagingType	171
ArcSec::DateAttribute	172
ArcSec::DateTimeAttribute	173
Arc::DelegationConsumer	174
Arc::DelegationConsumerSOAP	176
Arc::DelegationContainerSOAP	178
Arc::DelegationProvider	181
Arc::DelegationProviderSOAP	182
ArcSec::DenyOverridesCombiningAlg (Implement the "Deny-Overrides" algorithm)	184
Arc::DiskSpaceRequirementType	186
Arc::DNLListHandlerConfig	187
DataStaging::DTR (Data Transfer Request)	188
DataStaging::DTRCacheParameters (The configured cache directories)	192
DataStaging::DTRCallback (The base class from which all callback-enabled classes should be derived)	193
DataStaging::DTRErrorStatus (A class to represent error states reported by various components)	194
DataStaging::DTRLList (Global list of all active DTRs in the system)	196
DataStaging::DTRStatus (Class representing the status of a DTR)	199
ArcSec::DurationAttribute	201
Arc::Endpoint	202
Arc::EndpointQueryingStatus	203
Arc::EndpointQueryOptions< T >	204
Arc::EndpointQueryOptions< Endpoint >	205
Arc::EntityConsumer< T >	206
Arc::EntityContainer< T >	207
Arc::EntityRetriever< T >	208
Arc::EntityRetrieverPlugin< T >	209
Arc::EntityRetrieverPluginLoader< T >	210
Arc::EnvLockWrapper	211
ArcSec::EqualFunction (Evaluate whether the two values are equal)	212
ArcSec::EvalResult (Struct to record the xml node and effect, which will be used by Evaluator to get the information about which rule/policy(in xmlnode) is satisfied)	213
ArcSec::EvaluationCtx (EvaluationCtx , in charge of storing some context information for)	214
ArcSec::Evaluator (Interface for policy evaluation. Execute the policy evaluation, based on the request and policy)	215
ArcSec::EvaluatorContext (Context for evaluator. It includes the factories which will be used to create related objects)	218
ArcSec::EvaluatorLoader (EvaluatorLoader is implemented as a helper class for loading different Evaluator objects, like ArcEvaluator)	219
Arc::ExecutableType (Executable)	221
Arc::ExecutionEnvironmentAttributes	222
Arc::ExecutionEnvironmentType	223
Arc::ExecutionTarget (ExecutionTarget)	224
Arc::ExecutionTargetSet	226
Arc::ExpirationReminder (A class intended for internal use within counters)	227
Arc::FileAccess (Defines interface for accessing filesystems)	228

Arc::FileLock (A general file locking class)	230
Arc::FinderLoader	232
ArcSec::FnFactory (Interface for function factory class)	233
ArcSec::Function (Interface for function, which is in charge of evaluating two AttributeValue)	234
DataStaging::Generator (Simple Generator implementation)	235
ArcSec::GenericAttribute	236
Arc::GlobusResult	237
Arc::GLUE2 (GLUE2 parser)	238
Arc::GLUE2Entity< T >	239
Arc::GSSCredential	240
Arc::HakaClient	241
Arc:: FileAccess::header_t	242
Arc::HTTPClientInfo	243
Arc::InfoCache (Stores XML document in filesystem split into parts)	244
Arc::InfoCacheInterface	245
Arc::InfoFilter (Filters information document according to identity of requestor)	246
Arc::InfoRegister (Registration to ISIS interface)	247
Arc::InfoRegisterContainer	248
Arc::InfoRegisters (Handling multiple registrations to ISISes)	249
Arc::InfoRegistrar (Registration process associated with particular ISIS)	250
Arc::InformationContainer (Information System document container and processor)	251
Arc::InformationInterface (Information System message processor)	253
Arc::InformationRequest (Request for information in InfoSystem)	255
Arc::InformationResponse (Informational response from InfoSystem)	256
Arc::IniConfig	257
Arc::InitializeCredentialsType (Defines how user credentials are looked for)	258
Arc::InputFileType	259
ArcSec::InRangeFunction	260
Arc::IntraProcessCounter (A class for counters used by threads within a single process)	261
Arc::ISIS_description	265
Arc::IString	266
Arc::JobDescriptionParserLoader::iterator	267
Arc::Job (Job)	268
Arc::JobControllerPlugin	275
Arc::JobControllerPluginLoader	276
Arc::JobControllerPluginPluginArgument	278
Arc::JobControllerPluginTestACCControl	279
Arc::JobDescription	280
Arc::JobDescriptionParser (Abstract class for the different parsers)	283
Arc::JobDescriptionParserLoader	284
Arc::JobDescriptionParserResult	286
Arc::JobDescriptionParserTestACCControl	287
Arc::JobDescriptionResult	288
Arc::JobIdentificationType (Job identification)	289
Arc::JobListRetrieverPluginTESTControl	291
Arc::JobState	292
Arc::JobStateTEST	293
Arc::JobSupervisor (% JobSupervisor class)	294
list	300
Arc::LoadableModuleDescription	301
Arc::Loader (Plugins loader)	302
Arc::LocationAttributes	303
Arc::LocationType	304
Arc::LogDestination (A base class for log destinations)	305

Arc::LogFile (A class for logging to files)	306
Arc::Logger (A logger class)	308
Arc::LoggerContext (Container for logger configuration)	312
Arc::LoggerFormat	313
Arc::LogMessage (A class for log messages)	314
Arc::LogStream (A class for logging to ostreams)	316
ArcSec::MatchFunction (Evaluate whether arg1 (value in regular expression) matched arg0 (label in regular expression))	318
Arc::MCC (Message Chain Component - base class for every MCC plugin)	319
Arc::MCC_Status (A class for communication of MCC processing results)	322
Arc::MCCConfig	324
Arc::MCCInterface (Interface for communication between MCC, Service and Plexer objects)	325
Arc::MCCLoader (Creator of Message Component Chains (MCC))	326
Arc::MCCPluginArgument	328
Arc::MD5Sum (Implementation of MD5 checksum)	329
Arc::Message (Object being passed through chain of MCCs)	331
Arc::MessageAttributes (A class for storage of attribute values)	334
Arc::MessageAuth (Contains authencity information, authorization tokens and decisions)	337
Arc::MessageAuthContext (Handler for content of message auth* context)	338
Arc::MessageContext (Handler for content of message context)	339
Arc::MessageContextElement (Top class for elements contained in message context)	340
Arc::MessagePayload (Base class for content of message passed through chain)	341
Arc::ModuleDesc (Description of loadable module)	342
Arc::ModuleManager (Manager of shared libraries)	343
Arc::MultiSecAttr (Container of multiple SecAttr attributes)	346
Arc::MySQLDatabase	347
Arc::MySQLQuery	349
Arc::NotificationType	351
Arc::NS	352
Arc::OAuthConsumer	353
Arc::OpenIdpClient	355
Arc::OptIn< T >	356
Arc::OptionParser	357
ArcSec::OrderedCombiningAlg	358
Arc::OutputFileType	359
Arc::ParallelEnvironmentType	360
passwd	361
Arc::PathIterator (Class to iterate through elements of path)	362
Arc::PayloadRaw (Raw byte multi-buffer)	364
Arc::PayloadRawBuf	367
Arc::PayloadRawInterface (Random Access Payload for Message objects)	368
Arc::PayloadSOAP (Payload of Message with SOAP content)	370
Arc::PayloadStream (POSIX handle as Payload)	371
Arc::PayloadStreamInterface (Stream-like Payload for Message object)	375
Arc::PayloadWSRF (This class combines MessagePayload with WSRF)	378
ArcSec::PDP (Base class for Policy Decision Point plugins)	379
ArcSec::PDPConfigContext	380
ArcSec::PDPPPluginArgument	381
Arc::Period	382
ArcSec::PeriodAttribute	384
ArcSec::PermitOverridesCombiningAlg (Implement the "Permit-Overrides" algorithm)	385
Arc::Plexer (The Plexer class, used for routing messages to services)	387
Arc::PlexerEntry (A pair of label (regex) and pointer to MCC)	389
Arc::Plugin (Base class for loadable ARC components)	390

Arc::PluginArgument (Base class for passing arguments to loadable ARC components)	391
Arc::PluginDesc (Description of plugin)	393
Arc::PluginDescriptor (Description of ARC loadable component)	394
Arc::PluginsFactory (Generic ARC plugins loader)	395
ArcSec::Policy (Interface for containing and processing different types of policy)	397
ArcSec::PolicyStore::PolicyElement	400
ArcSec::PolicyParser (A interface which will isolate the policy object from actual policy storage (files, urls, database))	401
ArcSec::PolicyStore (Storage place for policy objects)	402
Arc::PrintF< T0, T1, T2, T3, T4, T5, T6, T7 >	403
Arc::PrintFBase	404
AuthN::PrivateKeyInfoCodec	405
DataStaging::Processor (The Processor performs pre- and post-transfer operations)	406
Arc::Profile	408
ArcCredential::PROXYCERTINFO_st	409
ArcCredential::PROXPOLICY_st	410
Arc::Query	411
Arc::Range< T >	414
Arc::Register_Info_Type	415
Arc::RegisteredService (RegisteredService - extension of Service performing self-registration) .	416
Arc::RegularExpression (A regular expression class)	417
Arc::RemoteLoggingType (Remote logging)	418
ArcSec::Request (Base class/Interface for request, includes a container for RequestItems and some operations)	419
ArcSec::RequestAttribute (Wrapper which includes AttributeValue object which is generated ac- cording to date type of one specific node in Request.xml)	421
ArcSec::RequestItem (Interface for request item container, <subjects, actions, objects, ctxs> tuple)	422
ArcSec::RequestTuple	423
Arc::ResourcesType	424
ArcSec::Response (Container for the evaluation results)	425
ArcSec::ResponseItem (Evaluation result concerning one RequestTuple)	426
ArcSec::ResponseList	427
Arc::EntityRetriever< T >::Result	428
Arc::Run	429
Arc::SAML2LoginClient	433
Arc::SAML2SSOHTTPClient	434
Arc::SAMLToken (Class for manipulating SAML Token Profile)	436
Arc::ScalableTime< T >	439
Arc::ScalableTime< int >	440
DataStaging::Scheduler (The Scheduler is the control centre of the data staging framework) .	441
Arc::SecAttr (This is an abstract interface to a security attribute)	443
Arc::SecAttrFormat (Export/import format)	445
Arc::SecAttrValue (This is an abstract interface to a security attribute)	446
ArcSec::SecHandler (Base class for simple security handling plugins)	447
Arc::SecHandlerConfig	448
ArcSec::SecHandlerConfig	449
ArcSec::SecHandlerPluginArgument	450
ArcSec::Security (Common stuff used by security related classes)	451
Arc::Service (Service - last component in a Message Chain)	452
Arc::ServiceEndpointRetrieverPluginTESTControl	455
Arc::ServicePluginArgument	456
Arc::SharedMutex	457
Arc::SimpleCondition (Simple triggered condition)	458

Arc::SimpleCounter	460
Arc::SlotRequirementType	461
Arc::SOAPMessage (Message restricted to SOAP payload)	462
Arc::Software (Used to represent software (names and version) and comparison)	464
Arc::SoftwareRequirement (Class used to express and resolve version requirements on software)	472
ArcSec::Source (Acquires and parses XML document from specified source)	479
ArcSec::SourceFile (Convenience class for obtaining XML document from file)	480
Arc::SourceType	481
ArcSec::SourceURL (Convenience class for obtaining XML document from remote URL)	482
DataStaging::DataDeliveryComm::Status (Plain C struct to pass information from executing process back to main thread)	483
ArcSec::StringAttribute	484
Arc::Submitter	485
Arc::SubmitterPlugin (Base class for the SubmitterPlugins)	486
Arc::SubmitterPluginArgument	487
Arc::SubmitterPluginLoader	488
Arc::SubmitterPluginTestACCControl	490
Arc::TargetInformationRetrieverPluginTESTControl	491
Arc::TargetType	492
Arc::EntityRetriever< T >::ThreadArg	493
Arc::ThreadDataItem (Base class for per-thread object)	494
Arc::ThreadedPointer< T > (Wrapper for pointer with automatic destruction and mutiple references)	496
Arc::ThreadedPointerBase (Helper class for ThreadedPointer)	498
Arc::ThreadInitializer	499
Arc::ThreadRegistry	500
Arc::Time (A class for storing and manipulating times)	501
ArcSec::TimeAttribute	505
Arc::TimedMutex	506
DataStaging::TransferParameters	507
DataStaging::TransferShares (TransferShares is used to implement fair-sharing and priorities)	508
DataStaging::TransferSharesConf (TransferSharesConf describes the configuration of TransferShares)	510
Arc::URL (Class to hold general URLs)	511
Arc::URLLocation (Class to hold a resolved URL location)	522
Arc::User	524
Arc::UserConfig (User configuration class)	525
Arc::UsernameToken (Interface for manipulation of WS-Security according to Username Token Profile)	550
Arc::UserSwitch	552
Arc::VOMSACInfo	553
Arc::VOMSTrustList	554
Arc::WSAEndpointReference (Interface for manipulation of WS-Adressing Endpoint Reference)	556
Arc::WSAHeader (Interface for manipulation WS-Addressing information in SOAP header)	558
Arc::WSRF (Base class for every WSRF message)	562
Arc::WSRFBaseFault (Base class for WSRF fault messages)	564
Arc::WSRFResourceUnavailableFault	565
Arc::WSRFResourceUnknownFault	566
Arc::WSRP (Base class for WS-ResourceProperties structures)	567
Arc::WSRPDeleteResourceProperties	569
Arc::WSRPDeleteResourcePropertiesRequest	570
Arc::WSRPDeleteResourcePropertiesRequestFailedFault	571
Arc::WSRPDeleteResourcePropertiesResponse	572
Arc::WSRPFault (Base class for WS-ResourceProperties faults)	573

Arc::WSRPGetMultipleResourcePropertiesRequest	574
Arc::WSRPGetMultipleResourcePropertiesResponse	575
Arc::WSRPGetResourcePropertyDocumentRequest	576
Arc::WSRPGetResourcePropertyDocumentResponse	577
Arc::WSRPGetPropertyRequest	578
Arc::WSRPGetPropertyResponse	579
Arc::WSRPIinsertResourceProperties	580
Arc::WSRPIinsertResourcePropertiesRequest	581
Arc::WSRPIinsertResourcePropertiesRequestFailedFault	582
Arc::WSRPIinsertResourcePropertiesResponse	583
Arc::WSRPInvalidModificationFault	584
Arc::WSRPInvalidResourcePropertyQNameFault	585
Arc::WSRPMModifyResourceProperties	586
Arc::WSRPPutResourcePropertyDocumentRequest	587
Arc::WSRPPutResourcePropertyDocumentResponse	588
Arc::WSRPQueryResourcePropertiesRequest	589
Arc::WSRPQueryResourcePropertiesResponse	590
Arc::WSRPResourcePropertyChangeFailure	591
Arc::WSRPSetResourcePropertiesRequest	592
Arc::WSRPSetResourcePropertiesResponse	593
Arc::WSRPSetResourcePropertyRequestFailedFault	594
Arc::WSRPUnableToModifyResourcePropertyFault	595
Arc::WSRPUnableToPutResourcePropertyDocumentFault	596
Arc::WSRPUpdateResourceProperties	597
Arc::WSRPUpdateResourcePropertiesRequest	598
Arc::WSRPUpdateResourcePropertiesRequestFailedFault	599
Arc::WSRPUpdateResourcePropertiesResponse	600
ArcSec::X500NameAttribute	601
Arc::X509Token (Class for manipulating X.509 Token Profile)	602
Arc::XmlContainer	604
Arc::XmlDatabase	605
Arc::XMLNode (Wrapper for LibXML library Tree interface)	606
Arc::XMLNodeContainer	617
Arc::XMLSecNode (Extends XMLNode class to support XML security operation)	619

Chapter 4

Namespace Documentation

4.1 Arc Namespace Reference

[Arc](#) namespace contains all core ARC classes.

Data Structures

- class [BrokerPluginArgument](#)
- class [BrokerPlugin](#)
- class [BrokerPluginLoader](#)
- class [Broker](#)
- class [CountedBroker](#)
- class [ExecutionTargetSet](#)
- class [ClientInterface](#)

Utility base class for [MCC](#).

- class [ClientTCP](#)

Class for setting up a [MCC](#) chain for TCP communication.

- struct [HTTPClientInfo](#)
- class [ClientHTTP](#)

Class for setting up a [MCC](#) chain for HTTP communication.

- class [ClientSOAP](#)
- class [SecHandlerConfig](#)
- class [DNListHandlerConfig](#)
- class [ARCPolicyHandlerConfig](#)
- class [ClientHTTPwithSAML2SSO](#)
- class [ClientSOAPwithSAML2SSO](#)
- class [ClientX509Delegation](#)
- class [ComputingServiceRetriever](#)
- class [ConfusaCertHandler](#)
- class [ConfusaParserUtils](#)
- class [HakaClient](#)
- class [OpenIdpClient](#)

- class [OAuthConsumer](#)
- class [SAML2LoginClient](#)
- class [SAML2SSOHTTPClient](#)
- class [Endpoint](#)
- class [EndpointQueryingStatus](#)
- class [EndpointQueryOptions](#)
- class [EndpointQueryOptions< Endpoint >](#)
- class [EntityRetrieverPlugin](#)
- class [EntityRetrieverPluginLoader](#)
- class [EntityConsumer](#)
- class [EntityContainer](#)
- class [EntityRetriever](#)
- class [ApplicationEnvironment](#)

ApplicationEnvironment.

- class [LocationAttributes](#)
- class [AdminDomainAttributes](#)
- class [ExecutionEnvironmentAttributes](#)
- class [ComputingManagerAttributes](#)
- class [ComputingShareAttributes](#)
- class [ComputingEndpointAttributes](#)
- class [ComputingServiceAttributes](#)
- class [LocationType](#)
- class [AdminDomainType](#)
- class [ExecutionEnvironmentType](#)
- class [ComputingManagerType](#)
- class [ComputingShareType](#)
- class [ComputingEndpointType](#)
- class [ComputingServiceType](#)
- class [ExecutionTarget](#)

ExecutionTarget.

- class [GLUE2](#)

GLUE2 parser.

- class [GLUE2Entity](#)
- class [Job](#)

Job.

- class [JobControllerPlugin](#)
- class [JobControllerPluginLoader](#)
- class [JobControllerPluginPluginArgument](#)
- class [OptIn](#)
- class [Range](#)
- class [ScalableTime](#)
- class [ScalableTime< int >](#)
- class [JobIdentificationType](#)

Job identification.

- class [ExecutableType](#)

Executable.

- class [RemoteLoggingType](#)

Remote logging.

- class [NotificationType](#)
- class [ApplicationType](#)
- class [SlotRequirementType](#)
- class [DiskSpaceRequirementType](#)
- class [ParallelEnvironmentType](#)
- class [ResourcesType](#)
- class [SourceType](#)
- class [TargetType](#)
- class [InputFileType](#)
- class [OutputFileType](#)
- class [DataStagingType](#)
- class [JobDescriptionResult](#)
- class [JobDescription](#)
- class [JobDescriptionParserResult](#)
- class [JobDescriptionParser](#)

Abstract class for the different parsers.

- class [JobDescriptionParserLoader](#)
- class [JobState](#)
- class [JobSupervisor](#)

% JobSupervisor class

- class [Software](#)

Used to represent software (names and version) and comparison.

- class [SoftwareRequirement](#)

Class used to express and resolve version requirements on software.

- class [Submitter](#)
- class [SubmitterPlugin](#)

Base class for the SubmitterPlugins.

- class [SubmitterPluginLoader](#)
- class [SubmitterPluginArgument](#)
- class [BrokerPluginTestACCControl](#)
- class [JobDescriptionParserTestACCControl](#)
- class [JobControllerPluginTestACCControl](#)
- class [SubmitterPluginTestACCControl](#)
- class [JobStateTEST](#)
- class [JobListRetrieverPluginTESTControl](#)
- class [ServiceEndpointRetrieverPluginTESTControl](#)
- class [TargetInformationRetrieverPluginTESTControl](#)
- class [Config](#)

Configuration element - represents (sub)tree of ARC configuration.

- class [BaseConfig](#)
- class [ArcLocation](#)

Determines ARC installation location.
- class [RegularExpression](#)

A regular expression class.
- class [ArcVersion](#)

Determines ARC HED libraries version.
- class [Base64](#)
- class [CheckSum](#)

Interface for checksum manipulations.
- class [CRC32Sum](#)

Implementation of CRC32 checksum.
- class [MD5Sum](#)

Implementation of MD5 checksum.
- class [Adler32Sum](#)

Implementation of Adler32 checksum.
- class [CheckSumAny](#)

Wrapper for [CheckSum](#) class.
- class [Counter](#)

A class defining a common interface for counters.
- class [CounterTicket](#)

A class for "tickets" that correspond to counter reservations.
- class [ExpirationReminder](#)

A class intended for internal use within counters.
- class [Period](#)
- class [Time](#)

A class for storing and manipulating times.
- class [Database](#)

Interface for calling database client library.
- class [Query](#)
- class [FileAccess](#)

Defines interface for accessing filesystems.
- class [FileLock](#)

A general file locking class.
- class [IniConfig](#)

- class [IntraProcessCounter](#)

A class for counters used by threads within a single process.

- class [PrintFBase](#)

- class [PrintF](#)

- class [IString](#)

- struct [LoggerFormat](#)

- class [LogMessage](#)

A class for log messages.

- class [LogDestination](#)

A base class for log destinations.

- class [LogStream](#)

A class for logging to ostreams.

- class [LogFile](#)

A class for logging to files.

- class [LoggerContext](#)

Container for logger configuration.

- class [Logger](#)

A logger class.

- class [MySQLDatabase](#)

- class [MySQLQuery](#)

- class [OptionParser](#)

- class [Profile](#)

- class [Run](#)

- class [ThreadDataItem](#)

Base class for per-thread object.

- class [SimpleCondition](#)

Simple triggered condition.

- class [SimpleCounter](#)

- class [TimedMutex](#)

- class [SharedMutex](#)

- class [ThreadedPointerBase](#)

Helper class for [ThreadedPointer](#).

- class [ThreadedPointer](#)

Wrapper for pointer with automatic destruction and multiple references.

- class [ThreadRegistry](#)

- class [ThreadInitializer](#)

- class [URL](#)

Class to hold general URLs.

- class [URLLocation](#)

Class to hold a resolved URL location.

- class [PathIterator](#)

Class to iterate through elements of path.

- class [User](#)
- class [UserSwitch](#)
- class [ConfigEndpoint](#)
- class [initializeCredentialsType](#)

Defines how user credentials are looked for.

- class [UserConfig](#)

User configuration class

- class [CertEnvLocker](#)
- class [EnvLockWrapper](#)
- class [AutoPointer](#)

Wrapper for pointer with automatic destruction.

- class [CountedPointer](#)

Wrapper for pointer with automatic destruction and multiple references.

- class [NS](#)

- class [XMLNode](#)

Wrapper for LibXML library Tree interface.

- class [XMLNodeContainer](#)
- class [CredentialError](#)
- class [Credential](#)
- class [VOMSACInfo](#)
- class [VOMSTrustList](#)
- class [CredentialStore](#)
- class [XmlContainer](#)
- class [XmlDatabase](#)
- class [DelegationConsumer](#)
- class [DelegationProvider](#)
- class [DelegationConsumerSOAP](#)
- class [DelegationProviderSOAP](#)
- class [DelegationContainerSOAP](#)
- class [GlobusResult](#)
- class [GSSCredential](#)
- class [InfoCache](#)

Stores XML document in filesystem split into parts.

- class [InfoCacheInterface](#)

- class [InfoFilter](#)

Filters information document according to identity of requestor.

- class [InfoRegister](#)

Registration to ISIS interface.

- class [InfoRegisters](#)
Handling multiple registrations to ISISes.

- struct [Register_Info_Type](#)
- struct [ISIS_description](#)
- class [InfoRegistrar](#)
Registration process associated with particular ISIS.

- class [InfoRegisterContainer](#)
- class [InformationInterface](#)
Information System message processor.

- class [InformationContainer](#)
Information System document container and processor.

- class [InformationRequest](#)
Request for information in InfoSystem.

- class [InformationResponse](#)
Informational response from InfoSystem.

- class [RegisteredService](#)
RegisteredService - extension of [Service](#) performing self-registration.

- class [FinderLoader](#)
- class [Loader](#)
Plugins loader.

- class [LoadableModuleDescription](#)
- class [ModuleManager](#)
Manager of shared libraries.

- class [PluginArgument](#)
Base class for passing arguments to loadable ARC components.

- class [Plugin](#)
Base class for loadable ARC components.

- struct [PluginDescriptor](#)
Description of ARC loadable component.

- class [PluginDesc](#)
Description of plugin.

- class [ModuleDesc](#)
Description of loadable module.

- class [PluginsFactory](#)

Generic ARC plugins loader.

- class [MCCIInterface](#)
Interface for communication between [MCC](#), [Service](#) and [Plexer](#) objects.
- class [MCC](#)
Message Chain Component - base class for every [MCC](#) plugin.
- class [MCCCConfig](#)
- class [MCCPluginArgument](#)
- class [MCC_Status](#)
A class for communication of [MCC](#) processing results.
- class [MCCLoader](#)
Creator of [Message](#) Component Chains ([MCC](#)).
- class [ChainContext](#)
Interface to chain specific functionality.
- class [MessagePayload](#)
Base class for content of message passed through chain.
- class [MessageContextElement](#)
Top class for elements contained in message context.
- class [MessageContext](#)
Handler for content of message context.
- class [MessageAuthContext](#)
Handler for content of message auth context.*
- class [Message](#)
Object being passed through chain of MCCs.
- class [AttributeIterator](#)
A const iterator class for accessing multiple values of an attribute.
- class [MessageAttributes](#)
A class for storage of attribute values.
- class [MessageAuth](#)
Contains authencity information, authorization tokens and decisions.
- class [PayloadRawInterface](#)
Random Access Payload for [Message](#) objects.
- struct [PayloadRawBuf](#)
- class [PayloadRaw](#)
Raw byte multi-buffer.

- class [PayloadSOAP](#)

Payload of [Message](#) with SOAP content.

- class [PayloadStreamInterface](#)

Stream-like Payload for [Message](#) object.

- class [PayloadStream](#)

POSIX handle as Payload.

- class [PlexerEntry](#)

A pair of label (regex) and pointer to [MCC](#).

- class [Plexer](#)

The [Plexer](#) class, used for routing messages to services.

- class [CIStringValue](#)

This class implements case insensitive strings as security attributes.

- class [SecAttrValue](#)

This is an abstract interface to a security attribute.

- class [SecAttrFormat](#)

Export/import format.

- class [SecAttr](#)

This is an abstract interface to a security attribute.

- class [MultiSecAttr](#)

Container of multiple [SecAttr](#) attributes.

- class [Service](#)

Service - last component in a [Message](#) Chain.

- class [ServicePluginArgument](#)

- class [SOAPMessage](#)

[Message](#) restricted to SOAP payload.

- class [ClassLoader](#)

- class [ClassLoaderPluginArgument](#)

- class [WSAEndpointReference](#)

Interface for manipulation of WS-Addressing [Endpoint](#) Reference.

- class [WSAHeader](#)

Interface for manipulation WS-Addressing information in SOAP header.

- class [SAMLToken](#)

Class for manipulating SAML Token [Profile](#).

- class [UsernameToken](#)

Interface for manipulation of WS-Security according to Username Token [Profile](#).

- class [X509Token](#)

Class for manipulating X.509 Token Profile.

- class [PayloadWSRF](#)

This class combines [MessagePayload](#) with [WSRF](#).

- class [WSRP](#)

Base class for WS-ResourceProperties structures.

- class [WSRPFault](#)

Base class for WS-ResourceProperties faults.

- class [WSRPIInvalidResourcePropertyQNameFault](#)

- class [WSRPResourcePropertyChangeFailure](#)

- class [WSRPUnableToPutResourcePropertyDocumentFault](#)

- class [WSRPIInvalidModificationFault](#)

- class [WSRPUnableToModifyResourcePropertyFault](#)

- class [WSRPSetResourcePropertyRequestFailedFault](#)

- class [WSRPIInsertResourcePropertiesRequestFailedFault](#)

- class [WSRPUpdateResourcePropertiesRequestFailedFault](#)

- class [WSRPDeleteResourcePropertiesRequestFailedFault](#)

- class [WSRPGetResourcePropertyDocumentRequest](#)

- class [WSRPGetResourcePropertyDocumentResponse](#)

- class [WSRPGetResourcePropertyRequest](#)

- class [WSRPGetResourcePropertyResponse](#)

- class [WSRPGetMultipleResourcePropertiesRequest](#)

- class [WSRPGetMultipleResourcePropertiesResponse](#)

- class [WSRPPutResourcePropertyDocumentRequest](#)

- class [WSRPPutResourcePropertyDocumentResponse](#)

- class [WSRPModifyResourceProperties](#)

- class [WSRPIInsertResourceProperties](#)

- class [WSRPUpdateResourceProperties](#)

- class [WSRPDeleteResourceProperties](#)

- class [WSRPSetResourcePropertiesRequest](#)

- class [WSRPSetResourcePropertiesResponse](#)

- class [WSRPIInsertResourcePropertiesRequest](#)

- class [WSRPIInsertResourcePropertiesResponse](#)

- class [WSRPUpdateResourcePropertiesRequest](#)

- class [WSRPUpdateResourcePropertiesResponse](#)

- class [WSRPDeleteResourcePropertiesRequest](#)

- class [WSRPDeleteResourcePropertiesResponse](#)

- class [WSRPQueryResourcePropertiesRequest](#)

- class [WSRPQueryResourcePropertiesResponse](#)

- class [WSRF](#)

Base class for every [WSRF](#) message.

- class [WSRFBaseFault](#)

Base class for [WSRF](#) fault messages.

- class [WSRFResourceUnknownFault](#)
- class [WSRFResourceUnavailableFault](#)
- class [XMLSecNode](#)

Extends [XMLNode](#) class to support XML security operation.

Typedefs

- typedef [Plugin](#) *(* [get_plugin_instance](#))([PluginArgument](#) *arg)
- typedef std::multimap< std::string, std::string > [AttrMap](#)
- typedef AttrMap::const_iterator [AttrConstIter](#)
- typedef AttrMap::iterator [AttrIter](#)

Enumerations

- enum [TimeFormat](#)
- enum [LogLevel](#)
- enum [LogFormat](#)
- enum [escape_type](#) { , [escape_octal](#), [escape_hex](#) }
- enum [StatusKind](#) { ,
[STATUS_OK](#) = 1, [GENERIC_ERROR](#) = 2, [PARSING_ERROR](#) = 4, [PROTOCOL_RECOGNIZED_ERROR](#) = 8,
[UNKNOWN_SERVICE_ERROR](#) = 16, [BUSY_ERROR](#) = 32, [SESSION_CLOSE](#) = 64 }
- enum [WSAFault](#) { , [WSAFaultUnknown](#), [WSAFaultInvalidAddressingHeader](#) }

Functions

- std::ostream & [operator<<](#) (std::ostream &, const [Period](#) &)
- std::ostream & [operator<<](#) (std::ostream &, const [Time](#) &)
- std::string [TimeStamp](#) (const [TimeFormat](#) &=Time::GetFormat())
- std::string [TimeStamp](#) ([Time](#), const [TimeFormat](#) &=Time::GetFormat())
- bool [FileCopy](#) (const std::string &source_path, const std::string &destination_path, uid_t uid, gid_t gid)
- bool [FileCopy](#) (const std::string &source_path, const std::string &destination_path)
- bool [FileCopy](#) (const std::string &source_path, int destination_handle)
- bool [FileCopy](#) (int source_handle, const std::string &destination_path)
- bool [FileCopy](#) (int source_handle, int destination_handle)
- bool [FileRead](#) (const std::string &filename, std::list< std::string > &data, uid_t uid=0, gid_t gid=0)
- bool [FileRead](#) (const std::string &filename, std::string &data, uid_t uid=0, gid_t gid=0)
- bool [FileCreate](#) (const std::string &filename, const std::string &data, uid_t uid=0, gid_t gid=0, mode_t mode=0)
- bool [FileStat](#) (const std::string &path, struct stat *st, bool follow_symlinks)
- bool [FileStat](#) (const std::string &path, struct stat *st, uid_t uid, gid_t gid, bool follow_symlinks)
- bool [FileLink](#) (const std::string &oldpath, const std::string &newpath, bool symbolic)
- bool [FileLink](#) (const std::string &oldpath, const std::string &newpath, uid_t uid, gid_t gid, bool symbolic)
- std::string [FileReadLink](#) (const std::string &path)
- std::string [FileReadLink](#) (const std::string &path, uid_t uid, gid_t gid)
- bool [FileDelete](#) (const std::string &path)

- bool `FileDelete` (const std::string &path, uid_t uid, gid_t gid)
- bool `DirCreate` (const std::string &path, mode_t mode, bool with_parents=false)
- bool `DirCreate` (const std::string &path, uid_t uid, gid_t gid, mode_t mode, bool with_parents=false)
- bool `DirDelete` (const std::string &path, bool recursive=true)
- bool `DirDelete` (const std::string &path, bool recursive, uid_t uid, gid_t gid)
- bool `TmpDirCreate` (std::string &path)
- bool `TmpFileCreate` (std::string &filename, const std::string &data, uid_t uid=0, gid_t gid=0, mode_t mode=0)
- bool `CanonicalDir` (std::string &name, bool leading_slash=true)
- void `GUID` (std::string &guid)
- std::string `UUID` (void)
- std::ostream & `operator<<` (std::ostream &os, `LogLevel` level)
- `LogLevel` `string_to_level` (const std::string &str)
- bool `istring_to_level` (const std::string &llStr, `LogLevel` &ll)
- bool `string_to_level` (const std::string &str, `LogLevel` &ll)
- std::string `level_to_string` (const `LogLevel` &level)
- `LogLevel` `old_level_to_level` (unsigned int old_level)
- template<typename T>
 T `stringto` (const std::string &s)
- template<typename T>
 bool `stringto` (const std::string &s, T &t)
- bool `strtoint` (const std::string &s, signed int &t, int base=10)
- bool `strtoint` (const std::string &s, unsigned int &t, int base=10)
- bool `strtoint` (const std::string &s, signed long &t, int base=10)
- bool `strtoint` (const std::string &s, unsigned long &t, int base=10)
- bool `strtoint` (const std::string &s, signed long long &t, int base=10)
- bool `strtoint` (const std::string &s, unsigned long long &t, int base=10)
- template<typename T>
 std::string `tostring` (T t, int width=0, int precision=0)
- std::string `inttostr` (signed long long t, int base=10, int width=0)
- std::string `inttostr` (unsigned long long t, int base=10, int width=0)
- std::string `inttostr` (signed int t, int base=10, int width=0)
- std::string `inttostr` (unsigned int t, int base=10, int width=0)
- std::string `inttostr` (signed long t, int base=10, int width=0)
- std::string `inttostr` (unsigned long t, int base=10, int width=0)
- std::string `booltostr` (bool b)
- bool `strtobool` (const std::string &s)
- bool `strtobool` (const std::string &s, bool &b)
- std::string `lower` (const std::string &s)
- std::string `upper` (const std::string &s)
- void `tokenize` (const std::string &str, std::vector<std::string> &tokens, const std::string &delimiters=" ", const std::string &start_quotes="", const std::string &end_quotes="")
- void `tokenize` (const std::string &str, std::list<std::string> &tokens, const std::string &delimiters=" ", const std::string &start_quotes="", const std::string &end_quotes="")
- std::string::size_type `get_token` (std::string &token, const std::string &str, std::string::size_type pos, const std::string &delimiters=" ", const std::string &start_quotes="", const std::string &end_quotes="")
- std::string `trim` (const std::string &str, const char *sep=NULL)
- std::string `strip` (const std::string &str)
- std::string `uri_encode` (const std::string &str, bool encode_slash)
- std::string `uri_unencode` (const std::string &str)

- std::string `convert_to_rdn` (const std::string &dn)
- std::string `escape_chars` (const std::string &str, const std::string &chars, char esc, bool excl, `escape_type` type=escape_char)
- std::string `unescape_chars` (const std::string &str, char esc, `escape_type` type=escape_char)
- bool `CreateThreadFunction` (void(*func)(void *), void *arg, `SimpleCounter` *count=NULL)
- std::list< `URL` > `ReadURLList` (const `URL` &urllist)
- std::string `GetEnv` (const std::string &var)
- std::string `GetEnv` (const std::string &var, bool &found)
- bool `SetEnv` (const std::string &var, const std::string &value, bool overwrite=true)
- void `UnsetEnv` (const std::string &var)
- void `EnvLockWrap` (bool all=false)
- void `EnvLockUnwrap` (bool all=false)
- void `EnvLockUnwrapComplete` (void)
- std::string `StrError` (int errnum=errno)
- bool `MatchXMLName` (const `XMLNode` &node1, const `XMLNode` &node2)
- bool `MatchXMLName` (const `XMLNode` &node, const char *name)
- bool `MatchXMLName` (const `XMLNode` &node, const std::string &name)
- bool `MatchXMLNamespace` (const `XMLNode` &node1, const `XMLNode` &node2)
- bool `MatchXMLNamespace` (const `XMLNode` &node, const char *uri)
- bool `MatchXMLNamespace` (const `XMLNode` &node, const std::string &uri)
- bool `createVOMSAC` (std::string &codedac, `Credential` &issuer_cred, `Credential` &holder_cred, std::vector< std::string > &fqan, std::vector< std::string > &targets, std::vector< std::string > &attributes, std::string &vuname, std::string &uri, int lifetime)
- bool `addVOMSAC` (`ArcCredential`::AC **&aclist, std::string &acorder, std::string &decodedac)
- bool `parseVOMSAC` (X509 *holder, const std::string &ca_cert_dir, const std::string &ca_cert_file, const std::string &vomsdir, `VOMSTrustList` &vomscert_trust_dn, std::vector< `VOMSACInfo` > &output, bool verify=true, bool reportall=false)
- bool `parseVOMSAC` (const `Credential` &holder_cred, const std::string &ca_cert_dir, const std::string &ca_cert_file, const std::string &vomsdir, `VOMSTrustList` &vomscert_trust_dn, std::vector< `VOMSACInfo` > &output, bool verify=true, bool reportall=false)
- char * `VOMSDecode` (const char *data, int size, int *j)
- std::string `getCredentialProperty` (const `Arc::Credential` &u, const std::string &property, const std::string &ca_cert_dir=std::string(""), const std::string &ca_cert_file=std::string(""), const std::string &vomsdir=std::string(""), const std::vector< std::string > &voms_trust_list=std::vector< std::string >())
- bool `OpenSSLInit` (void)
- void `HandleOpenSSLError` (void)
- void `HandleOpenSSLError` (int code)
- std::string `string` (`StatusKind` kind)
- const char * `ContentFromPayload` (const `MessagePayload` &payload)
- void `WSAFaultAssign` (SOAPEnvelope &mesage, `WSAFault` fid)
- `WSAFault` `WSAFaultExtract` (SOAPEnvelope &message)
- int `passphrase_callback` (char *buf, int size, int rwflag, void *)
- bool `init_xmlsec` (void)
- bool `final_xmlsec` (void)
- std::string `get_cert_str` (const char *certfile)
- `xmlSecKey` * `get_key_from_keystr` (const std::string &value)
- `xmlSecKey` * `get_key_from_keyfile` (const char *keyfile)
- std::string `get_key_from_certfile` (const char *certfile)
- `xmlSecKey` * `get_key_from_certstr` (const std::string &value)

- `xmlSecKeysMngrPtr load_key_from_keyfile` (`xmlSecKeysMngrPtr *keys_manager, const char *keyfile`)
- `xmlSecKeysMngrPtr load_key_from_certfile` (`xmlSecKeysMngrPtr *keys_manager, const char *certfile`)
- `xmlSecKeysMngrPtr load_key_from_certstr` (`xmlSecKeysMngrPtr *keys_manager, const std::string &certstr`)
- `xmlSecKeysMngrPtr load_trusted_cert_file` (`xmlSecKeysMngrPtr *keys_manager, const char *cert_file`)
- `xmlSecKeysMngrPtr load_trusted_cert_str` (`xmlSecKeysMngrPtr *keys_manager, const std::string &cert_str`)
- `xmlSecKeysMngrPtr load_trusted_certs` (`xmlSecKeysMngrPtr *keys_manager, const char *cafile, const char *capath`)
- `XMLNode get_node` (`XMLNode &parent, const char *name`)

Variables

- `const Glib::TimeVal ETERNAL`
- `const Glib::TimeVal HISTORIC`
- `const size_t thread_stacksize = (16 * 1024 * 1024)`
- `Logger CredentialLogger`
- `const char * plugins_table_name`

4.1.1 Detailed Description

`Arc` namespace contains all core ARC classes.

4.1.2 Typedef Documentation

4.1.2.1 `typedef AttrMap::const_iterator Arc::AttrConstIter`

A typedef of a `const_iterator` for `AttrMap`. This typedef is used as a shorthand for a `const_iterator` for `AttrMap`. It is used extensively within the `MessageAttributes` class as well as the `AttributesIterator` class, but is not visible externally.

4.1.2.2 `typedef AttrMap::iterator Arc::AttrIter`

A typedef of an (non-const) iterator for `AttrMap`. This typedef is used as a shorthand for a (non-const) iterator for `AttrMap`. It is used in one method within the `MessageAttributes` class, but is not visible externally.

4.1.2.3 `typedef std::multimap<std::string,std::string> Arc::AttrMap`

A typefed of a multimap for storage of message attributes. This typedef is used as a shorthand for a multimap that uses strings for keys as well as values. It is used within the `MessageAttributes` class for internal storage of message attributes, but is not visible externally.

4.1.2.4 **typedef Plugin*(* Arc::get_plugin_instance)(PluginArgument *arg)**

Constructor function of ARC loadable component. This function is called with plugin-specific argument and should produce and return valid instance of plugin. If plugin can't be produced by any reason (for example because passed argument is not applicable) then NULL is returned. No exceptions should be raised.

4.1.3 Enumeration Type Documentation

4.1.3.1 **enum Arc::escape_type**

Type of escaping or encoding to use.

Enumerator:

escape_octal place the escape character before the character being escaped

escape_hex octal encoding of the character hex encoding of the character

4.1.3.2 **enum Arc::LogFormat**

Output formats. Defines prefix for every message. LongFormat - all information about message is printed ShortFormat - only message level is printed DebugFormat - message time (microsecond precision) and time difference from previous message are printed. This format is mostly meant for profiling. EmptyFormat - only message is printed

4.1.3.3 **enum Arc::LogLevel**

Logging levels. Logging levels for tagging and filtering log messages. FATAL level designates very severe error events that will presumably lead the application to abort. ERROR level designates error events that might still allow the application to continue running. WARNING level designates potentially harmful situations. INFO level designates informational messages that highlight the progress of the application at coarse-grained level. VERBOSE level designates fine-grained informational events that will give additional information about the application. DEBUG level designates finer-grained informational events which should only be used for debugging purposes.

4.1.3.4 **enum Arc::StatusKind**

Status kinds (types). This enum defines a set of possible status kinds.

Enumerator:

STATUS_OK Default status - undefined error.

GENERIC_ERROR No error.

PARSING_ERROR Error does not fit any class.

PROTOCOL_RECOGNIZED_ERROR Error detected while parsing request/response.

UNKNOWN_SERVICE_ERROR Message does not fit into expected protocol.

BUSY_ERROR There is no destination configured for this message.

SESSION_CLOSE Message can't be processed now.

4.1.3.5 enum Arc::WSAFault

WS-Addressing possible faults.

Enumerator:

WSAFaultUnknown This is not a fault

WSAFaultInvalidAddressingHeader This is not a WS-Addressing fault

4.1.4 Function Documentation

4.1.4.1 bool Arc::addVOMSAC (ArcCredential::AC **& *aclist*, std::string & *acorder*, std::string & *decodedac*)

Add decoded AC string into a list of AC objects

Parameters:

aclist The list of AC objects (output)

acorder The order of AC objects (output)

decodedac The AC string that is decoded from the string returned from voms server (input)

4.1.4.2 bool Arc::CanonicalDir (std::string & *name*, bool *leading_slash* = true)

Removes ../ from 'name'. If leading_slash=true '/' will be added at the beginning of 'name' if missing. Otherwise it will be removed. The directory separator used here depends on the platform. Returns false if it is not possible to remove all the ../

4.1.4.3 const char* Arc::ContentFromPayload (const MessagePayload & *payload*)

Returns pointer to main memory chunk of [Message](#) payload. If no buffer is present or if payload is not of [PayloadRawInterface](#) type NULL is returned.

4.1.4.4 bool Arc::CreateThreadFunction (void(*)(void *) *func*, void * *arg*, SimpleCounter * *count* = NULL)

This macro behaves like function which makes thread of class' method. It accepts class instance and full name of method - like class::method. 'method' should not be static member of the class. Result is true if creation of thread succeeded. Specified instance must be valid during whole lifetime of thread. So probably it is safer to destroy 'instance' in 'method' just before exiting. Helper function to create simple thread. It takes care of all peculiarities of Glib::Thread API. As result it runs function 'func' with argument 'arg' in a separate thread. If count parameter not NULL then corresponding object will be incremented before function returns and then decremented when thread finished. Returns true on success.

4.1.4.5 bool Arc::createVOMSAC (std::string & *codedac*, Credential & *issuer_cred*, Credential & *holder_cred*, std::vector< std::string > & *fqan*, std::vector< std::string > & *targets*, std::vector< std::string > & *attributes*, std::string & *voname*, std::string & *uri*, int *lifetime*)

Create AC(Attribute Certificate) with voms specific format.

Parameters:

codedac The coded AC as output of this method

issuer_cred The issuer credential which is used to sign the AC

holder_cred The holder credential, the holder certificate is the one which carries AC The rest arguments are the same as the above method

4.1.4.6 bool Arc::DirCreate (const std::string & path, uid_t uid, gid_t gid, mode_t mode, bool with_parents = false)

Create a new directory using the specified uid and gid Specified uid and gid are used for accessing filesystem.

4.1.4.7 bool Arc::DirDelete (const std::string & path, bool recursive, uid_t uid, gid_t gid)

Delete a directory, and its content if recursive is true. If the directory is not empty and recursive is false DirDelete will fail. Specified uid and gid are used for accessing filesystem.

4.1.4.8 bool Arc::DirDelete (const std::string & path, bool recursive = true)

Delete a directory, and its content if recursive is true. If the directory is not empty and recursive is false DirDelete will fail.

4.1.4.9 void Arc::EnvLockUnwrap (bool all = false)

End code which is using setenv/getenv. Value of all must be same as in corresponding EnvLockWrap.

4.1.4.10 void Arc::EnvLockWrap (bool all = false)

Start code which is using setenv/getenv. Use all=true for setenv and all=false for getenv. Must always have corresponding EnvLockUnwrap.

4.1.4.11 std::string Arc::escape_chars (const std::string & str, const std::string & chars, char esc, bool excl, escape_type type = escape_char)

Escape or encode the given chars in str using the escape character esc. If excl is true then escape all characters not in chars

4.1.4.12 bool Arc::FileCopy (const std::string & source_path, const std::string & destination_path, uid_t uid, gid_t gid)

Utility functions for handling files and directories. Those functions offer possibility to access files and directories under user and group ids different from those of current user. Id switching is done in way safe for muti-threaded application. If any of specified ids is 0 then such id is not switched and current id is used instead. Copy file source_path to file destination_path. Specified uid and gid are used for accessing filesystem.

4.1.4.13 bool Arc::FileCreate (const std::string & *filename*, const std::string & *data*, uid_t *uid* = 0, gid_t *gid* = 0, mode_t *mode* = 0)

Simple method to create a new file containing given data. Specified uid and gid are used for accessing filesystem. An existing file is overwritten with the new data. Permissions of the created file are determined using the current umask. If protected access is required, [FileLock](#) should be used in addition to FileRead. If uid/gid are zero then no real switch of uid/gid is done.

4.1.4.14 bool Arc::FileDelete (const std::string & *path*, uid_t *uid*, gid_t *gid*)

Deletes file at path using the specified uid and gid Specified uid and gid are used for accessing filesystem.

4.1.4.15 bool Arc::FileLink (const std::string & *oldpath*, const std::string & *newpath*, uid_t *uid*, gid_t *gid*, bool *symbolic*)

Make symbolic or hard link of file using the specified uid and gid Specified uid and gid are used for accessing filesystem.

4.1.4.16 bool Arc::FileRead (const std::string & *filename*, std::string & *data*, uid_t *uid* = 0, gid_t *gid* = 0)

Simple method to read whole file content from filename. Specified uid and gid are used for accessing filesystem.

4.1.4.17 bool Arc::FileRead (const std::string & *filename*, std::list<std::string> & *data*, uid_t *uid* = 0, gid_t *gid* = 0)

Simple method to read file content from filename. Specified uid and gid are used for accessing filesystem. The content is split into lines with the new line character removed, and the lines are returned in the data list. If protected access is required, [FileLock](#) should be used in addition to FileRead.

4.1.4.18 std::string Arc::FileReadLink (const std::string & *path*, uid_t *uid*, gid_t *gid*)

Returns path at which symbolic link is pointing using the specified uid and gid Specified uid and gid are used for accessing filesystem.

4.1.4.19 bool Arc::FileStat (const std::string & *path*, struct stat * *st*, uid_t *uid*, gid_t *gid*, bool *follow_symlinks*)

Stat a file using the specified uid and gid and put info into the st struct Specified uid and gid are used for accessing filesystem.

4.1.4.20 bool Arc::final_xmlsec (void)

Finalize the xml security library

4.1.4.21 std::string Arc::get_cert_str (const char * *certfile*)

Get certificate in string format from certificate file

4.1.4.22 std::string Arc::get_key_from_certfile (const char * *certfile*)

Get public key in string format from certificate file

4.1.4.23 xmlSecKey* Arc::get_key_from_certstr (const std::string & *value*)

Get public key in xmlSecKey structure from certificate string (the string under "-----BEGIN CERTIFICATE-----" and "-----END CERTIFICATE-----")

4.1.4.24 xmlSecKey* Arc::get_key_from_keyfile (const char * *keyfile*)

Get key in xmlSecKey structure from key file

4.1.4.25 xmlSecKey* Arc::get_key_from_keystr (const std::string & *value*)

Get key in xmlSecKey structure from key in string format

4.1.4.26 XMLNode Arc::get_node (XMLNode & *parent*, const char * *name*)

Generate a new child [XMLNode](#) with specified name

4.1.4.27 std::string Arc::getCredentialProperty (const Arc::Credential & *u*, const std::string & *property*, const std::string & *ca_cert_dir* = std::string(""), const std::string & *ca_cert_file* = std::string(""), const std::string & *vomsdir* = std::string(""), const std::vector<std::string> & *voms_trust_list* = std::vector<std::string>())

Extract the needed field from the certificate.

Parameters:

u The proxy certificate which includes the voms specific formated AC.

property The property that caller would get, including: dn, voms:vo, voms:role, voms:group

ca_cert_dir

ca_cert_file

vomsdir

voms_trust_list the dn chain that is trusted when parsing voms AC

4.1.4.28 void Arc::GUID (std::string & *guid*)

Utilities for generating unique identifiers in the form 12345678-90ab-cdef-1234-567890abcdef. Generates a unique identifier using information such as IP address, current time etc.

4.1.4.29 bool Arc::init_xmlsec (void)

Initialize the xml security library, it should be called before the xml security functionality is used.

4.1.4.30 std::string Arc::inttostr (unsigned long *t*, int *base* = 10, int *width* = 0) [inline]

Convert unsigned long integer to textual representation for specied base. Result is padded with zeroes on left till width.

References inttostr().

4.1.4.31 std::string Arc::inttostr (signed long *t*, int *base* = 10, int *width* = 0) [inline]

Convert long integer to textual representation for specied base. Result is padded with zeroes on left till width.

References inttostr().

4.1.4.32 std::string Arc::inttostr (unsigned int *t*, int *base* = 10, int *width* = 0) [inline]

Convert unsigned integer to textual representation for specied base. Result is padded with zeroes on left till width.

References inttostr().

4.1.4.33 std::string Arc::inttostr (signed int *t*, int *base* = 10, int *width* = 0) [inline]

Convert integer to textual representation for specied base. Result is padded with zeroes on left till width.

References inttostr().

4.1.4.34 std::string Arc::inttostr (unsigned long long *t*, int *base* = 10, int *width* = 0)

Convert unsigned long long integer to textual representation for specied base. Result is padded with zeroes on left till width.

4.1.4.35 std::string Arc::inttostr (signed long long *t*, int *base* = 10, int *width* = 0)

Convert long long integer to textual representation for specied base. Result is padded with zeroes on left till width.

Referenced by inttostr().

4.1.4.36 bool Arc::istring_to_level (const std::string & *llStr*, LogLevel & *ll*)

Case-insensitive parsing of a string to a LogLevel with error response. The method will try to parse (case-insensitive) the argument string to a corresponding LogLevel. If the method succeeds, true will be returned and the argument *ll* will be set to the parsed LogLevel. If the parsing fails false will be returned. The parsing succeeds if *llStr* match (case-insensitively) one of the names of the LogLevel members.

Parameters:

llStr a string which should be parsed to a [Arc::LogLevel](#).

ll a [Arc::LogLevel](#) reference which will be set to the matching [Arc::LogLevel](#) upon successful parsing.

Returns:

true in case of successful parsing, otherwise false.

See also:

[LogLevel](#)

4.1.4.37 `xmlSecKeysMngrPtr Arc::load_key_from_certfile (xmlSecKeysMngrPtr *keys_manager, const char *certfile)`

Load public key from a certificate file into key manager

4.1.4.38 `xmlSecKeysMngrPtr Arc::load_key_from_certstr (xmlSecKeysMngrPtr *keys_manager, const std::string &certstr)`

Load public key from a certificate string into key manager

4.1.4.39 `xmlSecKeysMngrPtr Arc::load_key_from_keyfile (xmlSecKeysMngrPtr *keys_manager, const char *keyfile)`

Load private or public key from a key file into key manager

4.1.4.40 `xmlSecKeysMngrPtr Arc::load_trusted_cert_file (xmlSecKeysMngrPtr *keys_manager, const char *cert_file)`

Load trusted certificate from certificate file into key manager

4.1.4.41 `xmlSecKeysMngrPtr Arc::load_trusted_cert_str (xmlSecKeysMngrPtr *keys_manager, const std::string &cert_str)`

Load trusted certificate from certificate string into key manager

4.1.4.42 `xmlSecKeysMngrPtr Arc::load_trusted_certs (xmlSecKeysMngrPtr *keys_manager, const char *cafie, const char *capath)`

Load trusted certificates from a file or directory into key manager

4.1.4.43 `bool Arc::MatchXMLName (const XMLNode &node, const std::string &name)`

Returns true if 'name' matches name of 'node'. If name contains prefix it's checked too

4.1.4.44 `bool Arc::MatchXMLName (const XMLNode &node, const char *name)`

Returns true if 'name' matches name of 'node'. If name contains prefix it's checked too

4.1.4.45 bool Arc::MatchXMLName (const XMLNode & *node1*, const XMLNode & *node2*)

Returns true if underlying XML elements have same names

4.1.4.46 bool Arc::MatchXMLNamespace (const XMLNode & *node*, const std::string & *uri*)

Returns true if 'namespace' matches 'node's namespace.

4.1.4.47 bool Arc::MatchXMLNamespace (const XMLNode & *node*, const char * *uri*)

Returns true if 'namespace' matches 'node's namespace.

4.1.4.48 bool Arc::MatchXMLNamespace (const XMLNode & *node1*, const XMLNode & *node2*)

Returns true if underlying XML elements belong to same namespaces

4.1.4.49 bool Arc::OpenSSLInit (void)

This module contains various convenience utilities for using OpenSSL. Application may be linked to this module instead of OpenSSL libraries directly. This function initializes OpenSSL library. It may be called multiple times and makes sure everything is done properly and OpenSSL may be used in multi-threaded environment. Because this function makes use of [ArcLocation](#) it is advisable to call it after [ArcLocation::Init\(\)](#).

4.1.4.50 std::ostream& Arc::operator<< (std::ostream & *os*, LogLevel *level*)

Printing of LogLevel values to ostreams. Output operator so that LogLevel values can be printed in a nicer way.

4.1.4.51 std::ostream& Arc::operator<< (std::ostream &, const Time &)

Prints a Time-object to the given ostream -- typically cout.

4.1.4.52 std::ostream& Arc::operator<< (std::ostream &, const Period &)

Prints a Period-object to the given ostream -- typically cout.

4.1.4.53 bool Arc::parseVOMSAC (const Credential & *holder_cred*, const std::string & *ca_cert_dir*, const std::string & *ca_cert_file*, const std::string & *vomsdir*, VOMSTrustList & *vomscert_trust_dn*, std::vector< VOMSACInfo > & *output*, bool *verify* = **true, bool *reportall* = **false**)**

Parse the certificate. Similar to above one, but collects information From all certificates in a chain.

4.1.4.54 bool Arc::parseVOMSAC (X509 * holder, const std::string & ca_cert_dir, const std::string & ca_cert_file, const std::string & vomsdir, VOMSTrustList & vomsCertTrust_dn, std::vector< VOMSACInfo > & output, bool verify = true, bool reportall = false)

Parse the certificate, and output the attributes.

Parameters:

holder The proxy certificate which includes the voms specific formated AC.

ca_cert_dir The trusted certificates which are used to verify the certificate which is used to sign the AC

ca_cert_file The same as ca_cert_dir except it is a file instead of a directory. Only one of them need to be set

vomsdir The directory which include *.lsc file for each vo. For instance, a vo called "knowarc.eu" should have file vomsdir/knowarc/voms.knowarc.eu.lsc which contains on the first line the DN of the VOMS server, and on the second line the corresponding CA DN: /O=Grid/O=NorduGrid/OU=KnowARC/CN=voms.knowarc.eu /O=Grid/O=NorduGrid/CN=NorduGrid Certification Authority See more in : <https://twiki.cern.ch/twiki/bin/view/LCG/VomsFAQforServiceManagers>

output The parsed attributes (Role and Generic Attribute) . Each attribute is stored in element of a vector as a string. It is up to the consumer to understand the meaning of the attribute. There are two types of attributes stored in VOMS AC: AC_IETFATTR, AC_FULL_ATTRIBUTES. The AC_IETFATTR will be like /Role=Employee/Group=Tester/Capability=NULL The AC_FULL_ATTRIBUTES will be like knowarc:Degree=PhD (qualifier::name=value) In order to make the output attribute values be identical, the voms server information is added as prefix of the original attributes in AC. for AC_FULL_ATTRIBUTES, the voname + hostname is added: /vuname=knowarc.eu/hostname=arthur.hep.lu.se:15001/knowarc.eu/coredev:attribute1=1 for AC_IETFATTR, the 'VO' (vuname) is added: /VO=knowarc.eu/Group=coredev/Role=NULL/Capability=NULL /VO=knowarc.eu/Group= testers/Role=NULL/Capability=NULL

some other redundant attributes is provided: voname=knowarc.eu/hostname=arthur.hep.lu.se:15001

Parameters:

verify true: Verify the voms certificate is trusted based on the ca_cert_dir/ca_cert_file which specifies the CA certificates, and the vomsCertTrust_dn which specifies the trusted DN chain from voms server certificate to CA certificate. false: Not verify, which means the issuer of AC (voms server certificate is supposed to be trusted by default). In this case the parameters 'ca_cert_dir', 'ca_cert_file' and 'vomsCertTrust_dn' will not effect, and may be left empty. This case is specifically used by 'arcproxy --info' to list all of the attributes in AC, and not to need to verify if the AC's issuer is trusted.

reportall If set to true fills output with all attributes including those which failed passing test procedures. Validity of attributes can be checked through status members of output items. Combination of verify=true and reportall=true provides most information.

4.1.4.55 int Arc::passphrase_callback (char * buf, int size, int rwflag, void *)

callback method for inputting passphrase of key file

4.1.4.56 std::string Arc::string (StatusKind *kind*)

Conversion to string. Conversion from StatusKind to string.

Parameters:

kind The StatusKind to convert.

4.1.4.57 bool Arc::strtobool (const std::string & *s*, bool & *b*) [inline]

Convert string to bool Checks whether string is equal to one of "true", "false", "1" or "0", and if not returns false. If equal, true is returned and the bool reference is set to true, if string equals "true" or "1", otherwise it is set to false.

4.1.4.58 bool Arc::strtobool (const std::string & *s*) [inline]

Convert string to bool. Simply checks string if equal to "true" or "1".

4.1.4.59 bool Arc::strtoint (const std::string & *s*, unsigned long long & *t*, int *base* = 10)

Convert string to unsigned long long integer with specified base. Returns false if any argument is wrong.

4.1.4.60 bool Arc::strtoint (const std::string & *s*, signed long long & *t*, int *base* = 10)

Convert string to long long integer with specified base. Returns false if any argument is wrong.

4.1.4.61 bool Arc::strtoint (const std::string & *s*, unsigned long & *t*, int *base* = 10)

Convert string to unsigned long integer with specified base. Returns false if any argument is wrong.

4.1.4.62 bool Arc::strtoint (const std::string & *s*, signed long & *t*, int *base* = 10)

Convert string to long integer with specified base. Returns false if any argument is wrong.

4.1.4.63 bool Arc::strtoint (const std::string & *s*, unsigned int & *t*, int *base* = 10)

Convert string to unsigned integer with specified base. Returns false if any argument is wrong.

4.1.4.64 bool Arc::strtoint (const std::string & *s*, signed int & *t*, int *base* = 10)

Convert string to integer with specified base. Returns false if any argument is wrong.

4.1.4.65 std::string Arc::TimeStamp (Time, const TimeFormat & = Time::GetFormat())

Returns a time-stamp of some specified time in some format.

4.1.4.66 std::string Arc::TimeStamp (const TimeFormat & = Time::GetFormat ())

Returns a time-stamp of the current time in some format.

4.1.4.67 bool Arc::TmpDirCreate (std::string & path)

Create a temporary directory under the system defined temp location, and return its path. Uses mkdtemp if available, and a combination of random parameters if not. This latter method is not as safe as mkdtemp.

4.1.4.68 bool Arc::TmpFileCreate (std::string & filename, const std::string & data, uid_t uid = 0, gid_t gid = 0, mode_t mode = 0)

Simple method to create a temporary file containing given data. Specified uid and gid are used for accessing filesystem. Permissions of the created file are determined using the current umask. If uid/gid are zero then no real switch of uid/gid is done. Input value of filename argument is ignored. On output it contains path to created file. Content of data argument is written into created file.

4.1.4.69 std::string Arc::uri_encode (const std::string & str, bool encode_slash)

This method -encodes characters in URI str. Characters which are not unreserved according to RFC 3986 are encoded. If encode_slash is true forward slashes will also be encoded. It is useful to set encode_slash to false when encoding full paths. be encoded

4.1.4.70 char* Arc::VOMSDecode (const char * data, int size, int *j)

Decode the data which is encoded by voms server. Since voms code uses some specific coding method (not base64 encoding), we simply copy the method from voms code to here

4.1.4.71 void Arc::WSAFaultAssign (SOAPEnvelope & mesage, WSAFault fid)

Makes WS-Addressing fault. It fills SOAP Fault message with WS-Addressing fault related information.

4.1.4.72 WSAFault Arc::WSAFaultExtract (SOAPEnvelope & message)

Gets WS-addressing fault. Analyzes SOAP Fault message and returns WS-Addressing fault it represents.

4.1.5 Variable Documentation

4.1.5.1 Logger Arc::CredentialLogger

[Logger](#) to be used by all modules of credentials library

4.1.5.2 const char* Arc::plugins_table_name

Name of symbol referring to table of plugins. This C null terminated string specifies name of symbol which shared library should export to give an access to an array of [PluginDescriptor](#) elements. The array is terminated by element with all components set to NULL.

4.1.5.3 `const size_t Arc::thread_stacksize = (16 * 1024 * 1024)`

This module provides convenient helpers for Glibmm interface for thread management. So far it takes care of automatic initialization of threading environment and creation of simple detached threads. Always use it instead of glibmm/thread.h and keep among first includes. It safe to use it multiple times and to include it both from source files and other include files. Defines size of stack assigned to every new thread.

4.2 ArcCredential Namespace Reference

4.2.1 Detailed Description

Functions and constants for maintaining proxy certificates The code is derived from globus gsi, voms, and openssl-0.9.8e. The existing code for maintaining proxy certificates in OpenSSL only covers standard proxies and does not cover old Globus proxies, so here the Globus code is introduced.

Borrow the code about Attribute Certificate from VOMS The [VOMSAttribute.h](#) and [VOMSAttribute.cpp](#) are integration about code written by VOMS project, so here the original license follows.

4.2.2 Enumeration Type Documentation

4.2.2.1 enum ArcCredential::certType

Enumerator:

CERT_TYPE_EEC A end entity certificate

CERT_TYPE_CA A CA certificate

CERT_TYPE_GSI_3_IMPERSONATION_PROXY A X.509 Proxy Certificate Profile (pre-RFC) compliant impersonation proxy

CERT_TYPE_GSI_3_INDEPENDENT_PROXY A X.509 Proxy Certificate Profile (pre-RFC) compliant independent proxy

CERT_TYPE_GSI_3_LIMITED_PROXY A X.509 Proxy Certificate Profile (pre-RFC) compliant limited proxy

CERT_TYPE_GSI_3_RESTRICTED_PROXY A X.509 Proxy Certificate Profile (pre-RFC) compliant restricted proxy

CERT_TYPE_GSI_2_PROXY A legacy Globus impersonation proxy

CERT_TYPE_GSI_2_LIMITED_PROXY A legacy Globus limited impersonation proxy

CERT_TYPE_RFC_IMPERSONATION_PROXY A X.509 Proxy Certificate Profile RFC compliant impersonation proxy; RFC inheritAll proxy

CERT_TYPE_RFC_LIMITED_PROXY A X.509 Proxy Certificate Profile RFC compliant limited proxy

CERT_TYPE_RFC_RESTRICTED_PROXY A X.509 Proxy Certificate Profile RFC compliant restricted proxy

CERT_TYPE_RFC_ANYLANGUAGE_PROXY RFC anyLanguage proxy

4.3 DataStaging Namespace Reference

DataStaging contains all components for data transfer scheduling and execution.

Data Structures

- class [DataDelivery](#)
DataDelivery transfers data between specified physical locations.
- class [DataDeliveryComm](#)
This class provides an abstract interface for the Delivery layer.
- class [DataDeliveryCommHandler](#)
Singleton class handling all active DataDeliveryComm objects.
- class [DataDeliveryLocalComm](#)
This class starts, monitors and controls a local Delivery process.
- class [DataDeliveryRemoteComm](#)
This class contacts a remote service to make a Delivery request.
- class [TransferParameters](#)
- class [DTRCacheParameters](#)
The configured cache directories.
- class [DTRCallback](#)
The base class from which all callback-enabled classes should be derived.
- class [DTR](#)
Data Transfer Request.
- class [DTRLList](#)
Global list of all active DTRs in the system.
- class [DTRStatus](#)
Class representing the status of a DTR.
- class [DTRErrorStatus](#)
A class to represent error states reported by various components.
- class [Generator](#)
Simple Generator implementation.
- class [Processor](#)
The Processor performs pre- and post-transfer operations.
- class [Scheduler](#)
The Scheduler is the control centre of the data staging framework.

- class [TransferSharesConf](#)
TransferSharesConf describes the configuration of [TransferShares](#).
- class [TransferShares](#)
TransferShares is used to implement fair-sharing and priorities.

TypeDefs

- typedef [Arc::ThreadedPointer< DTR > DTR_ptr](#)
- typedef [Arc::ThreadedPointer< Arc::Logger > DTRLLogger](#)

Enumerations

- enum [ProcessState](#)
- enum [CacheState](#) {

CACHEABLE, **NON_CACHEABLE**, **CACHE_ALREADY_PRESENT**, **CACHE_DOWNLOADED**,

CACHE_LOCKED, **CACHE_SKIP**, **CACHE_NOT_USED** }

4.3.1 Detailed Description

[DataStaging](#) contains all components for data transfer scheduling and execution.

4.3.2 Enumeration Type Documentation

4.3.2.1 enum [DataStaging::CacheState](#)

Represents possible cache states of this [DTR](#).

Enumerator:

- CACHEABLE*** Source should be cached.
- NON_CACHEABLE*** Source should not be cached.
- CACHE_ALREADY_PRESENT*** Source is available in cache from before.
- CACHE_DOWNLOADED*** Source has just been downloaded and put in cache.
- CACHE_LOCKED*** Cache file is locked.
- CACHE_SKIP*** Source is cacheable but due to some problem should not be cached.
- CACHE_NOT_USED*** Cache was started but was not used.

5.18 Arc::Adler32Sum Class Reference

Implementation of Adler32 checksum.

```
#include <CheckSum.h>
```

Public Member Functions

- virtual void `start` (void)
- virtual void `add` (void *buf, unsigned long long int len)
- virtual void `end` (void)
- virtual void `result` (unsigned char *&res, unsigned int &len) const
- virtual int `print` (char *buf, int len) const
- virtual void `scan` (const char *)
- virtual operator bool () const
- virtual bool operator! () const

5.18.1 Detailed Description

Implementation of Adler32 checksum. This class is a specialized class of the [CheckSum](#) class. It provides an implementation of the Adler-32 checksum algorithm.

5.18.2 Member Function Documentation

5.18.2.1 virtual void Arc::Adler32Sum::add (void * buf, unsigned long long int len) [inline, virtual]

Add data to be checksummed. This method calculates the checksum of the passed data chuck, taking into account the previous state of this object.

Parameters:

`buf` pointer to data chuck to be checksummed.

`len` size of the data chuck.

Implements [Arc::CheckSum](#).

5.18.2.2 virtual void Arc::Adler32Sum::end (void) [inline, virtual]

Finalize the checksumming. This method finalizes the checksum algorithm, that is calculating the final checksum result.

Implements [Arc::CheckSum](#).

5.18.2.3 virtual int Arc::Adler32Sum::print (char * *buf*, int *len*) const [inline, virtual]

Retrieve result of checksum into a string. The passed string buf is filled with result of checksum algorithm in base 16. At most len characters are filled into buffer buf. The hexadecimal value is prepended with "<algorithm>:", where <algorithm> is one of "cksum", "md5" or "adler32" respectively corresponding to the result from the [CRC32Sum](#), [MD5Sum](#) and Adler32 classes.

Parameters:

buf pointer to buffer which should be filled with checksum result.
len max number of character filled into buffer.

Reimplemented from [Arc::CheckSum](#).

5.18.2.4 virtual void Arc::Adler32Sum::scan (const char * *buf*) [inline, virtual]

Set internal checksum state. This method sets the internal state to that of the passed textual representation. The format passed to this method must be the same as retrieved from the [CheckSum::print](#) method.

Parameters:

buf string containing textual representation of checksum

See also:

[CheckSum::print](#)

Implements [Arc::CheckSum](#).

5.18.2.5 virtual void Arc::Adler32Sum::start (void) [inline, virtual]

Initiate the checksum algorithm. This method must be called before starting a new checksum calculation.

Implements [Arc::CheckSum](#).

The documentation for this class was generated from the following file:

- CheckSum.h

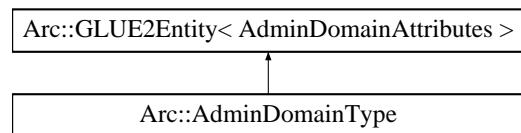

5.19 Arc::AdminDomainAttributes Class Reference

The documentation for this class was generated from the following file:

- ExecutionTarget.h

5.20 Arc::AdminDomainType Class Reference

Inheritance diagram for Arc::AdminDomainType::

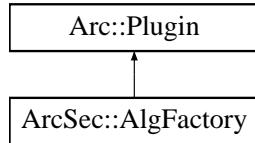

The documentation for this class was generated from the following file:

- ExecutionTarget.h

5.21 ArcSec::AlgFactory Class Reference

Interface for algorithm factory class.

```
#include <AlgFactory.h>Inheritance diagram for ArcSec::AlgFactory::
```

Public Member Functions

- virtual [CombiningAlg](#) * `createAlg` (const std::string &`type`)=0

5.21.1 Detailed Description

Interface for algorithm factory class. [AlgFactory](#) is in charge of creating [CombiningAlg](#) according to the algorithm type given as argument of method `createAlg`. This class can be inherited for implementing a factory class which can create some specific combining algorithm objects.

5.21.2 Member Function Documentation

5.21.2.1 virtual CombiningAlg* ArcSec::AlgFactory::createAlg (const std::string & `type`) [pure virtual]

creat algorithm object based on the type algorithm type

Parameters:

`type` The type of combining algorithm

Returns:

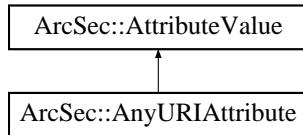

The object of [CombiningAlg](#)

The documentation for this class was generated from the following file:

- `AlgFactory.h`

5.22 ArcSec::AnyURIAttribute Class Reference

Inheritance diagram for ArcSec::AnyURIAttribute::

Public Member Functions

- virtual std::string [encode \(\)](#)
- std::string [getId \(\)](#)
- virtual std::string [getType \(\)](#)

5.22.1 Member Function Documentation

5.22.1.1 virtual std::string ArcSec::AnyURIAttribute::encode () [inline, virtual]

encode the value in a string format

Implements [ArcSec::AttributeValue](#).

5.22.1.2 std::string ArcSec::AnyURIAttribute::getId () [inline, virtual]

Get the AttributeId of the <Attribute>

Implements [ArcSec::AttributeValue](#).

5.22.1.3 virtual std::string ArcSec::AnyURIAttribute::getType () [inline, virtual]

Get the DataType of the <Attribute>

Implements [ArcSec::AttributeValue](#).

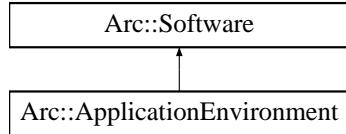

The documentation for this class was generated from the following file:

- AnyURIAttribute.h

5.23 Arc::ApplicationEnvironment Class Reference

[ApplicationEnvironment](#).

```
#include <ExecutionTarget.h>Inheritance diagram for Arc::ApplicationEnvironment::
```

5.23.1 Detailed Description

[ApplicationEnvironment](#). The ApplicationEnviroment is closely related to the definition given in [GLUE2](#). By extending the `Software` class the two [GLUE2](#) attributes `AppName` and `AppVersion` are mapped to two private members. However these can be obtained through the inherited member methods `getName` and `getVersion`.

[GLUE2](#) description: A description of installed application software or software environment characteristics available within one or more Execution Environments.

The documentation for this class was generated from the following file:

- `ExecutionTarget.h`

5.24 Arc::ApplicationType Class Reference

Data Fields

- ExecutableType Executable
- std::string Input
- std::string Output
- std::string Error
- std::list< ExecutableType > PreExecutable
- std::list< ExecutableType > PostExecutable
- std::string LogDir
- std::list< RemoteLoggingType > RemoteLogging

5.24.1 Field Documentation

5.24.1.1 std::string Arc::ApplicationType::Error

Standard error. The Error string specifies the relative path to the job session directory of the file which standard error of the job should be written to.

5.24.1.2 ExecutableType Arc::ApplicationType::Executable

Main executable to be run. The Executable object specifies the main executable which should be run by the job created by the job description enclosing this object. Note that in some job description languages specifying a main executable is not essential.

5.24.1.3 std::string Arc::ApplicationType::Input

Standard input. The Input string specifies the relative path to the job session directory of the file to be used for standard input for the job.

5.24.1.4 std::string Arc::ApplicationType::LogDir

Name of logging directory. The LogDir string specifies the name of the logging directory at the execution service which should be used to access log files for the job.

5.24.1.5 std::string Arc::ApplicationType::Output

Standard output. The Output string specifies the relative path to the job session directory of the file which standard output of the job should be written to.

5.24.1.6 std::list<ExecutableType> Arc::ApplicationType::PostExecutable

Executables to be run after the main executable. The PostExecutable object specifies a number of executables which should be executed after invoking the main application, where the main application is either the main executable (Executable) or the specified run time environment (RunTimeEnvironment in the [ResourcesType](#) class).

5.24.1.7 std::list<ExecutableType> Arc::ApplicationType::PreExecutable

Executables to be run before the main executable. The PreExecutable object specifies a number of executables which should be executed before invoking the main application, where the main application is either the main executable (Executable) or the specified run time environment (RunTimeEnvironment in the [ResourcesType](#) class).

5.24.1.8 std::list<RemoteLoggingType> Arc::ApplicationType::RemoteLogging

Remote logging services. The RemoteLogging list specifies the services to use for logging job information. See the [RemoteLoggingType](#) class for more details.

The documentation for this class was generated from the following file:

- JobDescription.h

5.25 Arc::ArcLocation Class Reference

Determines ARC installation location.

```
#include <ArcLocation.h>
```

Static Public Member Functions

- static void [Init](#) (std::string path)
- static const std::string & [Get](#) ()
- static std::list< std::string > [GetPlugins](#) ()

5.25.1 Detailed Description

Determines ARC installation location.

5.25.2 Member Function Documentation

5.25.2.1 static std::list<std::string> Arc::ArcLocation::GetPlugins () [static]

Returns ARC plugins directory location. Main source is value of variable ARC_PLUGIN_PATH, otherwise path is derived from installation location.

5.25.2.2 static void Arc::ArcLocation::Init (std::string *path*) [static]

Initializes location information. Main source is value of variable ARC_LOCATION, otherwise path to executable provided in is used. If nothing works then warning message is sent to logger and initial installation prefix is used.

The documentation for this class was generated from the following file:

- ArcLocation.h

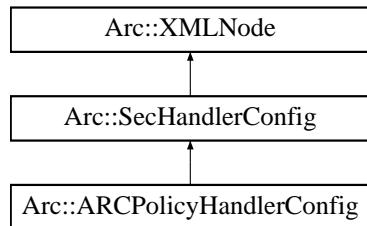

5.26 ArcSec::ArcPeriod Struct Reference

The documentation for this struct was generated from the following file:

- DateTimeAttribute.h

5.27 Arc::ARCPolicyHandlerConfig Class Reference

Inheritance diagram for Arc::ARCPolicyHandlerConfig::

The documentation for this class was generated from the following file:

- ClientInterface.h

5.28 Arc::ArcVersion Class Reference

Determines ARC HED libraries version.

```
#include <ArcVersion.h>
```

5.28.1 Detailed Description

Determines ARC HED libraries version.

The documentation for this class was generated from the following file:

- ArcVersion.h

5.29 ArcSec::Attr Struct Reference

[Attr](#) contains a tuple of attribute type and value.

```
#include <Request.h>
```

5.29.1 Detailed Description

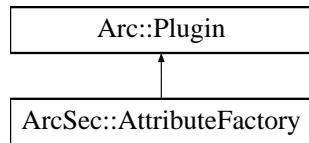

[Attr](#) contains a tuple of attribute type and value.

The documentation for this struct was generated from the following file:

- Request.h

5.30 ArcSec::AttributeFactory Class Reference

#include <AttributeFactory.h> Inheritance diagram for ArcSec::AttributeFactory::

5.30.1 Detailed Description

Base attribute factory class

The documentation for this class was generated from the following file:

- `AttributeFactory.h`

5.31 Arc::AttributeIterator Class Reference

A const iterator class for accessing multiple values of an attribute.

```
#include <MessageAttributes.h>
```

Public Member Functions

- [AttributeIterator \(\)](#)
- const std::string & [operator* \(\) const](#)
- const std::string * [operator-> \(\) const](#)
- const std::string & [key \(void\) const](#)
- const [AttributeIterator & operator++ \(\)](#)
- [AttributeIterator operator++ \(int\)](#)
- bool [hasMore \(\) const](#)

Protected Member Functions

- [AttributeIterator \(AttrConstIter begin, AttrConstIter end\)](#)

Protected Attributes

- [AttrConstIter current_](#)
- [AttrConstIter end_](#)

Friends

- class [MessageAttributes](#)

5.31.1 Detailed Description

A const iterator class for accessing multiple values of an attribute. This is an iterator class that is used when accessing multiple values of an attribute. The [getAll\(\)](#) method of the [MessageAttributes](#) class returns an [AttributeIterator](#) object that can be used to access the values of the attribute.

Typical usage is:

```
MessageAttributes attributes;
...
for (AttributeIterator iterator=attributes.getAll("Foo:Bar");
     iterator.hasMore(); ++iterator)
    std::cout << *iterator << std::endl;
```

5.31.2 Constructor & Destructor Documentation

5.31.2.1 Arc::AttributeIterator::AttributeIterator ()

Default constructor. The default constructor. Does nothing since all attributes are instances of well-behaving STL classes.

5.31.2.2 Arc::AttributeIterator::AttributeIterator (AttrConstIter *begin*, AttrConstIter *end*) [protected]

Protected constructor used by the [MessageAttributes](#) class. This constructor is used to create an iterator for iteration over all values of an attribute. It is not supposed to be visible externally, but is only used from within the getAll() method of [MessageAttributes](#) class.

Parameters:

- begin* A const_iterator pointing to the first matching key-value pair in the internal multimap of the [MessageAttributes](#) class.
- end* A const_iterator pointing to the first key-value pair in the internal multimap of the [MessageAttributes](#) class where the key is larger than the key searched for.

5.31.3 Member Function Documentation

5.31.3.1 bool Arc::AttributeIterator::hasMore () const

Predicate method for iteration termination. This method determines whether there are more values for the iterator to refer to.

Returns:

Returns true if there are more values, otherwise false.

5.31.3.2 const std::string& Arc::AttributeIterator::key (void) const

The key of attribute. This method returns reference to key of attribute to which iterator refers.

5.31.3.3 const std::string& Arc::AttributeIterator::operator* () const

The dereference operator. This operator is used to access the current value referred to by the iterator.

Returns:

A (constant reference to a) string representation of the current value.

5.31.3.4 AttributeIterator Arc::AttributeIterator::operator++ (int)

The postfix advance operator. Advances the iterator to the next value. Works intuitively.

Returns:

An iterator referring to the value referred to by this iterator before the advance.

5.31.3.5 const AttributeIterator& Arc::AttributeIterator::operator++ ()

The prefix advance operator. Advances the iterator to the next value. Works intuitively.

Returns:

A const reference to this iterator.

5.31.3.6 const std::string* Arc::AttributeIterator::operator-> () const

The arrow operator. Used to call methods for value objects (strings) conveniently.

5.31.4 Friends And Related Function Documentation

5.31.4.1 friend class MessageAttributes [friend]

The [MessageAttributes](#) class is a friend. The constructor that creates an [AttributeIterator](#) that is connected to the internal multimap of the [MessageAttributes](#) class should not be exposed to the outside, but it still needs to be accessible from the getAll() method of the [MessageAttributes](#) class. Therefore, that class is a friend.

5.31.5 Field Documentation

5.31.5.1 AttrConstIter Arc::AttributeIterator::current_ [protected]

A const_iterator pointing to the current key-value pair. This iterator is the internal representation of the current value. It points to the corresponding key-value pair in the internal multimap of the [MessageAttributes](#) class.

5.31.5.2 AttrConstIter Arc::AttributeIterator::end_ [protected]

A const_iterator pointing beyond the last key-value pair. A const_iterator pointing to the first key-value pair in the internal multimap of the [MessageAttributes](#) class where the key is larger than the key searched for.

The documentation for this class was generated from the following file:

- [MessageAttributes.h](#)

5.32 ArcSec::AttributeProxy Class Reference

Interface for creating the [AttributeValue](#) object, it will be used by [AttributeFactory](#).

```
#include <AttributeProxy.h>
```

Public Member Functions

- virtual [AttributeValue](#) * [getAttribute](#) (const [Arc::XMLNode](#) &node)=0

5.32.1 Detailed Description

Interface for creating the [AttributeValue](#) object, it will be used by [AttributeFactory](#). The [AttributeProxy](#) object will be inserted into [AttributeFactory](#); and the [getAttribute\(node\)](#) method will be called inside [AttributeFactory.createvalue\(node\)](#), in order to create a specific [AttributeValue](#)

5.32.2 Member Function Documentation

5.32.2.1 virtual [AttributeValue](#)* [ArcSec::AttributeProxy::getAttribute](#) (const [Arc::XMLNode](#) &node) [pure virtual]

Create a [AttributeValue](#) object according to the information inside the [XMLNode](#) as parameter.

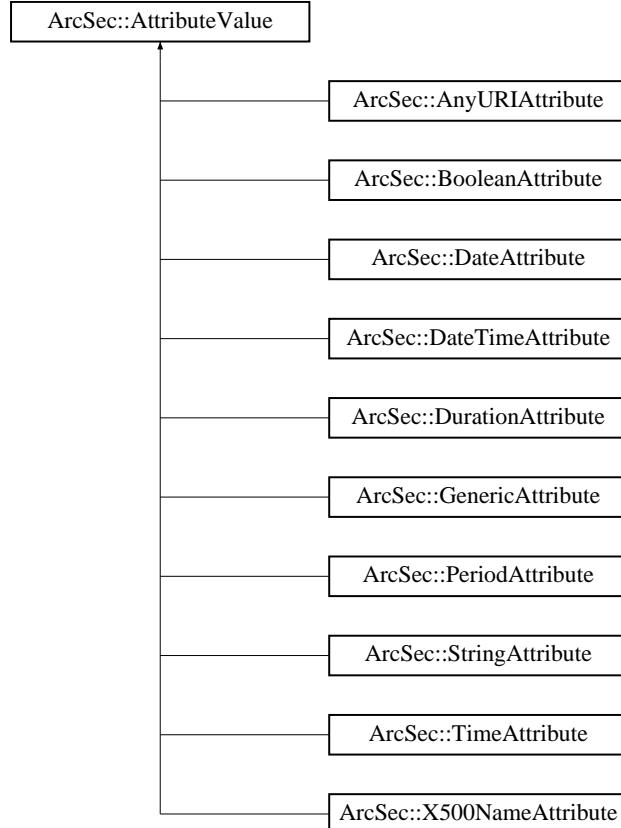

The documentation for this class was generated from the following file:

- AttributeProxy.h

5.33 ArcSec::AttributeValue Class Reference

Interface for containing different type of <Attribute> node for both policy and request.

```
#include <AttributeValue.h>
```

Public Member Functions

- virtual bool [equal](#) (AttributeValue *value, bool check_id=true)=0
- virtual std::string [encode](#) ()=0
- virtual std::string [getType](#) ()=0
- virtual std::string [getId](#) ()=0

5.33.1 Detailed Description

Interface for containing different type of <Attribute> node for both policy and request. <Attribute> contains different "Type" definition; Each type of <Attribute> needs different approach to compare the value. Any specific class which is for processing specific "Type" shoud inherit this class. The "Type" supported so far is: [StringAttribute](#), [DateAttribute](#), [TimeAttribute](#), [DurationAttribute](#), [PeriodAttribute](#), [AnyURIAttribute](#), [X500NameAttribute](#)

5.33.2 Member Function Documentation

5.33.2.1 virtual std::string ArcSec::AttributeValue::encode () [pure virtual]

encode the value in a string format

Implemented in [ArcSec::AnyURIAttribute](#), [ArcSec::BooleanAttribute](#), [ArcSec::DateTimeAttribute](#), [ArcSec::TimeAttribute](#), [ArcSec::DateAttribute](#), [ArcSec::DurationAttribute](#), [ArcSec::PeriodAttribute](#), [ArcSec::GenericAttribute](#), [ArcSec::StringAttribute](#), and [ArcSec::X500NameAttribute](#).

5.33.2.2 virtual bool ArcSec::AttributeValue::equal (AttributeValue * *value*, bool *check_id* = true) [pure virtual]

Evluate whether "this" equale to the parameter value

5.33.2.3 virtual std::string ArcSec::AttributeValue::getId () [pure virtual]

Get the AttributeId of the <Attribute>

Implemented in [ArcSec::AnyURIAttribute](#), [ArcSec::BooleanAttribute](#), [ArcSec::DateTimeAttribute](#), [ArcSec::TimeAttribute](#), [ArcSec::DateAttribute](#), [ArcSec::DurationAttribute](#), [ArcSec::PeriodAttribute](#), [ArcSec::GenericAttribute](#), [ArcSec::StringAttribute](#), and [ArcSec::X500NameAttribute](#).

5.33.2.4 virtual std::string ArcSec::AttributeValue::getType () [pure virtual]

Get the DataType of the <Attribute>

Implemented in [ArcSec::AnyURIAttribute](#), [ArcSec::BooleanAttribute](#), [ArcSec::DateTimeAttribute](#), [ArcSec::TimeAttribute](#), [ArcSec::DateAttribute](#), [ArcSec::DurationAttribute](#), [ArcSec::PeriodAttribute](#), [ArcSec::GenericAttribute](#), [ArcSec::StringAttribute](#), and [ArcSec::X500NameAttribute](#).

The documentation for this class was generated from the following file:

- [AttributeValue.h](#)

5.34 ArcSec::Attrs Class Reference

[Attrs](#) is a container for one or more [Attr](#).

```
#include <Request.h>
```

5.34.1 Detailed Description

[Attrs](#) is a container for one or more [Attr](#). [Attrs](#) includes includes methods for inserting, getting items, and counting size as well

The documentation for this class was generated from the following file:

- Request.h

5.35 ArcSec::AuthzRequest Struct Reference

The documentation for this struct was generated from the following file:

- PDP.h

5.36 ArcSec::AuthzRequestSection Struct Reference

```
#include <PDP.h>
```

5.36.1 Detailed Description

These structures are based on the request schema for [PDP](#), so far it can apply to the ArcPDP's request schema, see `src/hed/pdc/Request.xsd` and `src/hed/pdc/Request.xml`. It could also apply to the XACMLPDP's request schema, since the difference is minor.

Another approach is, the service composes/marshalls the xml structure directly, then the service should use difference code to compose for ArcPDP's request schema and XACMLPDP's schema, which is not so good.

The documentation for this struct was generated from the following file:

- `PDP.h`

5.37 Arc::AutoPointer< T > Class Template Reference

Wrapper for pointer with automatic destruction.

```
#include <Utils.h>
```

Public Member Functions

- [AutoPointer \(void\)](#)
- [AutoPointer \(T *o\)](#)
- [~AutoPointer \(void\)](#)
- [T & operator* \(void\) const](#)
- [T * operator-> \(void\) const](#)
- [operator bool \(void\) const](#)
- [bool operator! \(void\) const](#)
- [T * Ptr \(void\) const](#)
- [T * Release \(void\)](#)

5.37.1 Detailed Description

```
template<typename T> class Arc::AutoPointer< T >
```

Wrapper for pointer with automatic destruction. If ordinary pointer is wrapped in instance of this class it will be automatically destroyed when instance is destroyed. This is useful for maintaining pointers in scope of one function. Only pointers returned by new() are supported.

The documentation for this class was generated from the following file:

- [Utils.h](#)

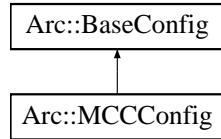

5.38 Arc::Base64 Class Reference

The documentation for this class was generated from the following file:

- Base64.h

5.39 Arc::BaseConfig Class Reference

#include <ArcConfig.h> Inheritance diagram for Arc::BaseConfig::

Public Member Functions

- void [AddPluginsPath](#) (const std::string &path)
- void [AddPrivateKey](#) (const std::string &path)
- void [AddCertificate](#) (const std::string &path)
- void [AddProxy](#) (const std::string &path)
- void [AddCAFile](#) (const std::string &path)
- void [AddCADir](#) (const std::string &path)
- void [AddOverlay](#) (XMLNode cfg)
- void [GetOverlay](#) (std::string fname)
- virtual XMLNode [MakeConfig](#) (XMLNode cfg) const

5.39.1 Detailed Description

Configuration for client interface. It contains information which can't be expressed in class constructor arguments. Most probably common things like software installation location, identity of user, etc.

5.39.2 Member Function Documentation

5.39.2.1 void Arc::BaseConfig::AddCADir (const std::string & path)

Add CA directory

5.39.2.2 void Arc::BaseConfig::AddCAFile (const std::string & path)

Add CA file

5.39.2.3 void Arc::BaseConfig::AddCertificate (const std::string & path)

Add certificate

5.39.2.4 void Arc::BaseConfig::AddOverlay (XMLNode cfg)

Add configuration overlay

5.39.2.5 void Arc::BaseConfig::AddPluginsPath (const std::string & path)

Adds non-standard location of plugins

5.39.2.6 void Arc::BaseConfig::AddPrivateKey (const std::string & path)

Add private key

5.39.2.7 void Arc::BaseConfig::AddProxy (const std::string & path)

Add credentials proxy

5.39.2.8 void Arc::BaseConfig::GetOverlay (std::string fname)

Read overlay from file

5.39.2.9 virtual XMLNode Arc::BaseConfig::MakeConfig (XMLNode cfg) const [virtual]

Adds configuration part corresponding to stored information into common configuration tree supplied in 'cfg' argument. Returns reference to XML node representing configuration of [ModuleManager](#)

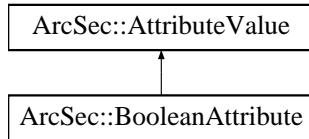

Reimplemented in [Arc::MCCConfig](#).

The documentation for this class was generated from the following file:

- ArcConfig.h

5.40 ArcSec::BooleanAttribute Class Reference

Inheritance diagram for ArcSec::BooleanAttribute:::

Public Member Functions

- virtual std::string [encode \(\)](#)

5.48 Arc::ChainContext Class Reference

Interface to chain specific functionality.

```
#include <MCCLoader.h>
```

Public Member Functions

- `operator PluginsFactory *()`

5.48.1 Detailed Description

Interface to chain specific functionality. Object of this class is associated with every [MCCLoader](#) object. It is accessible for [MCC](#) and [Service](#) components and provides an interface to manipulate chains stored in [Loader](#). This makes it possible to modify chains dynamically - like deploying new services on demand.

5.48.2 Member Function Documentation

5.48.2.1 Arc::ChainContext::operator PluginsFactory *() [inline]

Returns associated [PluginsFactory](#) object

References [Arc::Loader::factory_](#).

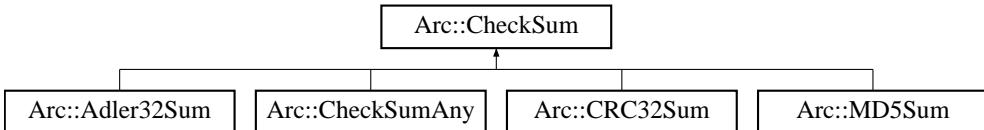

The documentation for this class was generated from the following file:

- `MCCLoader.h`

5.49 Arc::CheckSum Class Reference

Interface for checksum manipulations.

```
#include <CheckSum.h>
```

Public Member Functions

- [CheckSum \(void\)](#)
- virtual void [start \(void\)=0](#)
- virtual void [add \(void *buf, unsigned long long int len\)=0](#)
- virtual void [end \(void\)=0](#)
- virtual void [result \(unsigned char *&res, unsigned int &len\) const =0](#)
- virtual int [print \(char *buf, int len\) const](#)
- virtual void [scan \(const char *buf\)=0](#)
- virtual [operator bool \(void\) const](#)
- virtual bool [operator! \(void\) const](#)

5.49.1 Detailed Description

Interface for checksum manipulations. This class is an interface and is extended in the specialized classes [CRC32Sum](#), [MD5Sum](#) and [Adler32Sum](#). The interface is among others used during data transfers through DataBuffer class

See also:

[CRC32Sum](#)
[MD5Sum](#)
[Adler32Sum](#)

5.49.2 Member Function Documentation

5.49.2.1 virtual void Arc::CheckSum::add (void * buf, unsigned long long int len) [pure virtual]

Add data to be checksummed. This method calculates the checksum of the passed data chuck, taking into account the previous state of this object.

Parameters:

buf pointer to data chuck to be checksummed.
len size of the data chuck.

Implemented in [Arc::CRC32Sum](#), [Arc::MD5Sum](#), [Arc::Adler32Sum](#), and [Arc::CheckSumAny](#).

Referenced by [Arc::CheckSumAny::add\(\)](#).

5.49.2.2 virtual void Arc::CheckSum::end (void) [pure virtual]

Finalize the checksumming. This method finalizes the checksum algorithm, that is calculating the final checksum result.

Implemented in [Arc::CRC32Sum](#), [Arc::MD5Sum](#), [Arc::Adler32Sum](#), and [Arc::CheckSumAny](#).

Referenced by [Arc::CheckSumAny::end\(\)](#).

5.49.2.3 virtual int Arc::CheckSum::print (char * buf, int len) const [inline, virtual]

Retrieve result of checksum into a string. The passed string buf is filled with result of checksum algorithm in base 16. At most len characters is filled into buffer buf. The hexadecimal value is prepended with "<algorithm>:", where <algorithm> is one of "cksum", "md5" or "adler32" respectively corresponding to the result from the [CRC32Sum](#), [MD5Sum](#) and Adler32 classes.

Parameters:

buf pointer to buffer which should be filled with checksum result.

len max number of character filled into buffer.

Reimplemented in [Arc::CRC32Sum](#), [Arc::MD5Sum](#), [Arc::Adler32Sum](#), and [Arc::CheckSumAny](#).

Referenced by [Arc::CheckSumAny::print\(\)](#).

5.49.2.4 virtual void Arc::CheckSum::scan (const char * buf) [pure virtual]

Set internal checksum state. This method sets the internal state to that of the passed textual representation. The format passed to this method must be the same as retrieved from the [CheckSum::print](#) method.

Parameters:

buf string containing textual representation of checksum

See also:

[CheckSum::print](#)

Implemented in [Arc::CRC32Sum](#), [Arc::MD5Sum](#), [Arc::Adler32Sum](#), and [Arc::CheckSumAny](#).

Referenced by [Arc::CheckSumAny::scan\(\)](#).

5.49.2.5 virtual void Arc::CheckSum::start (void) [pure virtual]

Initiate the checksum algorithm. This method must be called before starting a new checksum calculation.

Implemented in [Arc::CRC32Sum](#), [Arc::MD5Sum](#), [Arc::Adler32Sum](#), and [Arc::CheckSumAny](#).

Referenced by [Arc::CheckSumAny::start\(\)](#).

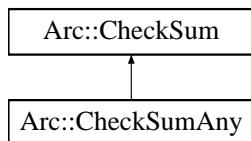

The documentation for this class was generated from the following file:

- [CheckSum.h](#)

5.50 Arc::CheckSumAny Class Reference

Wrapper for [CheckSum](#) class.

```
#include <CheckSum.h>
```

Public Member Functions

- virtual void [start](#) (void)
- virtual void [add](#) (void *buf, unsigned long long int len)
- virtual void [end](#) (void)
- virtual void [result](#) (unsigned char *&res, unsigned int &len) const
- virtual int [print](#) (char *buf, int len) const
- virtual void [scan](#) (const char *buf)
- virtual [operator bool](#) (void) const
- virtual bool [operator!](#) (void) const

Static Public Member Functions

- static std::string [FileChecksum](#) (const std::string &filepath, type tp=md5, bool decimalbase=false)

5.50.1 Detailed Description

Wrapper for [CheckSum](#) class. To be used for manipulation of any supported checksum type in a transparent way.

5.50.2 Member Function Documentation

5.50.2.1 virtual void Arc::CheckSumAny::add (void * buf, unsigned long long int len) [inline, virtual]

Add data to be checksummed. This method calculates the checksum of the passed data chuck, taking into account the previous state of this object.

Parameters:

buf pointer to data chuck to be checksummed.

len size of the data chuck.

Implements [Arc::CheckSum](#).

References [Arc::CheckSum::add\(\)](#).

5.50.2.2 virtual void Arc::CheckSumAny::end (void) [inline, virtual]

Finalize the checksumming. This method finalizes the checksum algorithm, that is calculating the final checksum result.

Implements [Arc::CheckSum](#).

References Arc::CheckSum::end().

5.50.2.3 static std::string Arc::CheckSumAny::FileChecksum (const std::string &filepath, type tp = md5, bool decimalbase = false) [static]

Get checksum of a file. This method provide an easy way to get the checksum of a file, by only specifying the path to the file. Optionally the checksum type can be specified, if not the MD5 algorithm will be used.

Parameters:

filepath path to file of which checksum should be calculated

tp type of checksum algorithm to use, default is md5.

decimalbase specifies whether output should be in base 10 or 16

Returns:

a string containing the calculated checksum is returned.

5.50.2.4 virtual int Arc::CheckSumAny::print (char *buf, int len) const [inline, virtual]

Retrieve result of checksum into a string. The passed string buf is filled with result of checksum algorithm in base 16. At most len chacters is filled into buffer buf. The hexadecimal value is prepended with "<algorithm>:", where <algorithm> is one of "cksum", "md5" or "adler32" respectively corresponding to the result from the [CRC32Sum](#), [MD5Sum](#) and Adler32 classes.

Parameters:

buf pointer to buffer which should be filled with checksum result.

len max number of character filled into buffer.

Reimplemented from [Arc::CheckSum](#).

References Arc::CheckSum::print().

5.50.2.5 virtual void Arc::CheckSumAny::scan (const char *buf) [inline, virtual]

Set internal checksum state. This method sets the internal state to that of the passed textual representation. The format passed to this method must be the same as retrieved from the [CheckSum::print](#) method.

Parameters:

buf string containing textual representation of checksum

See also:

[CheckSum::print](#)

Implements [Arc::CheckSum](#).

References Arc::CheckSum::scan().

5.50.2.6 virtual void Arc::CheckSumAny::start (void) [inline, virtual]

Initiate the checksum algorithm. This method must be called before starting a new checksum calculation.

Implements [Arc::CheckSum](#).

References Arc::CheckSum::start().

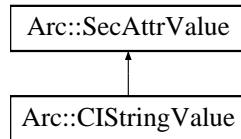

The documentation for this class was generated from the following file:

- [CheckSum.h](#)

5.51 Arc::CIStringValue Class Reference

This class implements case insensitive strings as security attributes.

```
#include <CIStringValue.h>
```

Public Member Functions

- [CIStringValue \(\)](#)
- [CIStringValue \(const char *ss\)](#)
- [CIStringValue \(const std::string &ss\)](#)
- virtual [operator bool \(\)](#)

Protected Member Functions

- virtual bool [equal \(SecAttrValue &b\)](#)

5.51.1 Detailed Description

This class implements case insensitive strings as security attributes. This is an example of how to inherit [SecAttrValue](#). The class is meant to implement security attributes that are case insensitive strings.

5.51.2 Constructor & Destructor Documentation

5.51.2.1 Arc::CIStringValue::CIStringValue ()

Default constructor

5.51.2.2 Arc::CIStringValue::CIStringValue (const char * ss)

This is a constructor that takes a string literal.

5.51.2.3 Arc::CIStringValue::CIStringValue (const std::string & ss)

This is a constructor that takes a string object.

5.51.3 Member Function Documentation

5.51.3.1 virtual bool Arc::CIStringValue::equal (SecAttrValue & b) [protected, virtual]

This function returns true if two strings are the same apart from letter case

5.51.3.2 virtual Arc::CIStringValue::operator bool () [virtual]

This function returns false if the string is empty or uninitialized

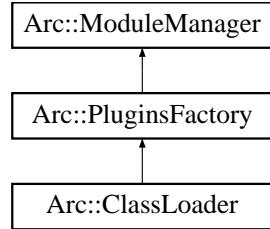

Reimplemented from [Arc::SecAttrValue](#).

The documentation for this class was generated from the following file:

- CIStringValue.h

5.52 Arc::ClassLoader Class Reference

Inheritance diagram for Arc::ClassLoader::

5.54 Arc::ClientHTTP Class Reference

Class for setting up a [MCC](#) chain for HTTP communication.

```
#include <ClientInterface.h>
```

Inheritance diagram for Arc::ClientHTTP::

5.54.1 Detailed Description

Class for setting up a [MCC](#) chain for HTTP communication. The [ClientHTTP](#) class inherits from the [ClientTCP](#) class and adds an HTTP [MCC](#) to the chain.

The documentation for this class was generated from the following file:

- ClientInterface.h

5.55 Arc::ClientHTTPwithSAML2SSO Class Reference

Public Member Functions

- [ClientHTTPwithSAML2SSO \(\)](#)
- [MCC_Status process \(const std::string &method, PayloadRawInterface *request, HTTPClientInfo *info, PayloadRawInterface **response, const std::string &idp_name, const std::string &username, const std::string &password, const bool reuse_authn=false\)](#)

5.55.1 Constructor & Destructor Documentation

5.55.1.1 Arc::ClientHTTPwithSAML2SSO::ClientHTTPwithSAML2SSO () [inline]

Constructor creates [MCC](#) chain and connects to server.

5.55.2 Member Function Documentation

5.55.2.1 MCC_Status Arc::ClientHTTPwithSAML2SSO::process (const std::string & *method*, PayloadRawInterface * *request*, HTTPClientInfo * *info*, PayloadRawInterface ** *response*, const std::string & *idp_name*, const std::string & *username*, const std::string & *password*, const bool *reuse_authn = false*)

Send HTTP request and receive response.

The documentation for this class was generated from the following file:

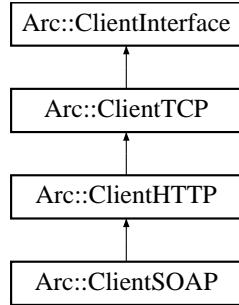

- ClientSAML2SSO.h

5.56 Arc::ClientInterface Class Reference

Utility base class for [MCC](#).

```
#include <ClientInterface.h>
```

Inheritance diagram for Arc::ClientInterface::

5.56.1 Detailed Description

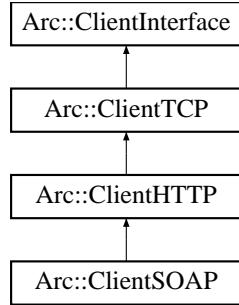

Utility base class for [MCC](#). The [ClientInterface](#) class is a utility base class used for configuring a client side [Message Chain Component \(MCC\)](#) chain and loading it into memory. It has several specializations of increasing complexity of the [MCC](#) chains.

The documentation for this class was generated from the following file:

- ClientInterface.h

5.57 Arc::ClientSOAP Class Reference

#include <ClientInterface.h> Inheritance diagram for Arc::ClientSOAP::

Public Member Functions

- [ClientSOAP \(\)](#)
- [MCC_Status process \(PayloadSOAP *request, PayloadSOAP **response\)](#)
- [MCC_Status process \(const std::string &action, PayloadSOAP *request, PayloadSOAP **response\)](#)
- [MCC * GetEntry \(\)](#)
- [void AddSecHandler \(XMLNode handlercfg, const std::string &libname="", const std::string &libpath ""\)](#)
- [virtual bool Load \(\)](#)

5.57.1 Detailed Description

Class with easy interface for sending/receiving SOAP messages over HTTP(S/G). It takes care of configuring [MCC](#) chain and making an entry point.

5.57.2 Constructor & Destructor Documentation

5.57.2.1 Arc::ClientSOAP::ClientSOAP () [inline]

Constructor creates [MCC](#) chain and connects to server.

5.57.3 Member Function Documentation

5.57.3.1 void Arc::ClientSOAP::AddSecHandler (XMLNode *handlercfg*, const std::string & *libname* = "", const std::string & *libpath* = "")

Adds security handler to configuration of SOAP [MCC](#)

Reimplemented from [Arc::ClientHTTP](#).

5.57.3.2 MCC* Arc::ClientSOAP::GetEntry () [inline]

Returns entry point to SOAP [MCC](#) in configured chain. To initialize entry point [Load\(\)](#) method must be called.

Reimplemented from [Arc::ClientHTTP](#).

5.57.3.3 virtual bool Arc::ClientSOAP::Load () [virtual]

Instantiates pluggable elements according to generated configuration

Reimplemented from [Arc::ClientHTTP](#).

5.57.3.4 MCC_Status Arc::ClientSOAP::process (const std::string & *action*, PayloadSOAP * *request*, PayloadSOAP ** *response*)

Send SOAP request with specified SOAP action and receive response.

5.57.3.5 MCC_Status Arc::ClientSOAP::process (PayloadSOAP * *request*, PayloadSOAP ** *response*)

Send SOAP request and receive response.

The documentation for this class was generated from the following file:

- ClientInterface.h

5.58 Arc::ClientSOAPwithSAML2SSO Class Reference

Public Member Functions

- [ClientSOAPwithSAML2SSO \(\)](#)
- [MCC_Status process \(PayloadSOAP *request, PayloadSOAP **response, const std::string &idp_name, const std::string &username, const std::string &password, const bool reuse_authn=false\)](#)

5.58.1 Constructor & Destructor Documentation

5.58.1.1 Arc::ClientSOAPwithSAML2SSO::ClientSOAPwithSAML2SSO () [inline]

Constructor creates [MCC](#) chain and connects to server.

5.58.2 Member Function Documentation

5.58.2.1 MCC_Status Arc::ClientSOAPwithSAML2SSO::process (const std::string & action, PayloadSOAP * request, PayloadSOAP ** response, const std::string & idp_name, const std::string & username, const std::string & password, const bool reuse_authn = false)

Send SOAP request with specified SOAP action and receive response.

5.58.2.2 MCC_Status Arc::ClientSOAPwithSAML2SSO::process (PayloadSOAP * request, PayloadSOAP ** response, const std::string & idp_name, const std::string & username, const std::string & password, const bool reuse_authn = false)

Send SOAP request and receive response.

The documentation for this class was generated from the following file:

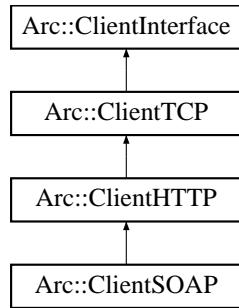

- ClientSAML2SSO.h

5.59 Arc::ClientTCP Class Reference

Class for setting up a [MCC](#) chain for TCP communication.

```
#include <ClientInterface.h>
```

Inheritance diagram for Arc::ClientTCP::

5.59.1 Detailed Description

Class for setting up a [MCC](#) chain for TCP communication. The [ClientTCP](#) class is a specialization of the [ClientInterface](#) which sets up a client [MCC](#) chain for TCP communication, and optionally with a security layer on top which can be either TLS, GSI or SSL3.

The documentation for this class was generated from the following file:

- ClientInterface.h

5.60 Arc::ClientX509Delegation Class Reference

Public Member Functions

- `ClientX509Delegation ()`
- `bool createDelegation (DelegationType deleg, std::string &delegation_id)`
- `bool acquireDelegation (DelegationType deleg, std::string &delegation_cred, std::string &delegation_id, const std::string cred_identity = "", const std::string cred_delegator_ip = "", const std::string username = "", const std::string password = "")`

5.60.1 Constructor & Destructor Documentation

5.60.1.1 Arc::ClientX509Delegation::ClientX509Delegation () [inline]

Constructor creates [MCC](#) chain and connects to server.

5.60.2 Member Function Documentation

5.60.2.1 bool Arc::ClientX509Delegation::acquireDelegation (DelegationType *deleg*, std::string & *delegation_cred*, std::string & *delegation_id*, const std::string *cred_identity* = "", const std::string *cred_delegator_ip* = "", const std::string *username* = "", const std::string *password* = "")

Acquire delegation credential from delegation service. This method should be called by intermediate service ('n+1' service as explained on above) in order to use this delegation credential on behalf of the EEC's holder.

Parameters:

deleg Delegation type

delegation_id delegation ID which is used to look up the credential by delegation service

cred_identity the identity (in case of x509 credential, it is the DN of EEC credential).

cred_delegator_ip the IP address of the credential delegator. Regard of delegation, an intermediate service should accomplish three tasks: 1. Acquire 'n' level delegation credential (which is delegated by 'n-1' level delegator) from delegation service; 1. Create 'n+1' level delegation credential to delegation service; 2. Use 'n' level delegation credential to act on behalf of the EEC's holder. In case of absense of delegation_id, the 'n-1' level delegator's IP address and credential's identity are supposed to be used for look up the delegation credential from delegation service.

5.60.2.2 bool Arc::ClientX509Delegation::createDelegation (DelegationType *deleg*, std::string & *delegation_id*)

Create the delegation credential according to the different remote delegation service. This method should be called by holder of EEC(end entity credential) which would delegate its EEC credential, or by holder of delegated credential(normally, the holder is intermediate service) which would further delegate the credential (on behalf of the original EEC's holder) (for instance, the 'n' intermediate service creates a delegation credential, then the 'n+1' intermediate service aquires this delegation credential from the delegation service and also acts on behalf of the EEC's holder by using this delegation credential).

Parameters:

deleg Delegation type

delegation_id For gridsite delegation service, the delegation_id is supposed to be created by client side, and sent to service side; for ARC delegation service, the delegation_id is supposed to be created by service side, and returned back. So for gridsite delegation service, this parameter is treated as input, while for ARC delegation service, it is treated as output.

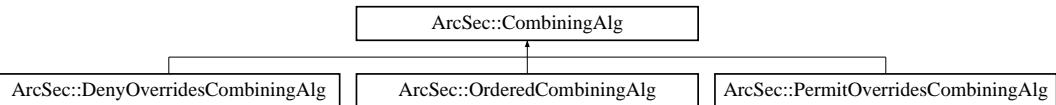

The documentation for this class was generated from the following file:

- ClientX509Delegation.h

5.61 ArcSec::CombiningAlg Class Reference

Interface for combining algorithm.

```
#include <CombiningAlg.h>
```

Public Member Functions

- virtual Result **combine** (EvaluationCtx *ctx, std::list< Policy * > policies)=0
- virtual const std::string & **getalgId** (void) const =0

5.61.1 Detailed Description

Interface for combining algorithm. This class is used to implement a specific combining algorithm for combining policies.

5.61.2 Member Function Documentation

5.61.2.1 virtual Result ArcSec::CombiningAlg::combine (EvaluationCtx * *ctx*, std::list< Policy * > *policies*) [pure virtual]

Evaluate request against policy, and if there are more than one policies, combine the evaluation results according to the combining algorithm implemented inside in the method combine(ctx, policies) itself.

Parameters:

ctx The information about request is included

policies The "match" and "eval" method inside each policy will be called, and then those results from each policy will be combined according to the combining algorithm inside CombiningAlg class.

Implemented in [ArcSec::DenyOverridesCombiningAlg](#), and [ArcSec::PermitOverridesCombiningAlg](#).

5.61.2.2 virtual const std::string& ArcSec::CombiningAlg::getalgId (void) const [pure virtual]

Get the identifier of the combining algorithm class

Returns:

The identity of the algorithm

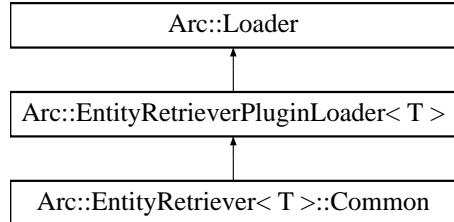

Implemented in [ArcSec::DenyOverridesCombiningAlg](#), and [ArcSec::PermitOverridesCombiningAlg](#).

The documentation for this class was generated from the following file:

- CombiningAlg.h

Data Fields

- std::string [Name](#)
- int [MaxMainMemory](#)
- int [MaxVirtualMemory](#)
- int [MaxDiskSpace](#)
- std::map< [Period](#), int > [FreeSlotsWithDuration](#)

5.70.1 Field Documentation

5.70.1.1 std::map<Period, int> Arc::ComputingShareAttributes::FreeSlotsWithDuration

FreeSlotsWithDuration std::map<Period, int>. This attribute express the number of free slots with their time limits. The keys in the std::map are the time limit ([Period](#)) for the number of free slots stored as the value (int). If no time limit has been specified for a set of free slots then the key will equal Period(LONG_-MAX).

5.70.1.2 int Arc::ComputingShareAttributes::MaxDiskSpace

MaxDiskSpace UInt64 0..1 GB. The maximum disk space that a job is allowed use in the working; if the limit is hit, then the LRMS MAY kill the job. A negative value specifies that this member is undefined.

5.70.1.3 int Arc::ComputingShareAttributes::MaxMainMemory

MaxMainMemory UInt64 0..1 MB. The maximum physical RAM that a job is allowed to use; if the limit is hit, then the LRMS MAY kill the job. A negative value specifies that this member is undefined.

5.70.1.4 int Arc::ComputingShareAttributes::MaxVirtualMemory

MaxVirtualMemory UInt64 0..1 MB. The maximum total memory size (RAM plus swap) that a job is allowed to use; if the limit is hit, then the LRMS MAY kill the job. A negative value specifies that this member is undefined.

5.70.1.5 std::string Arc::ComputingShareAttributes::Name

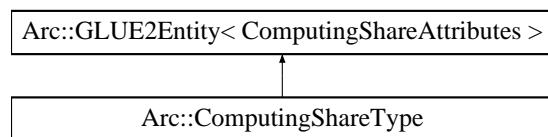

Name String 0..1. Human-readable name. This variable represents the ComputingShare.Name attribute of [GLUE2](#).

5.72 Arc::Config Class Reference

Configuration element - represents (sub)tree of ARC configuration.

#include <ArcConfig.h> Inheritance diagram for Arc::Config::

Public Member Functions

- [Config \(\)](#)
- [Config \(const char *filename\)](#)
- [Config \(const std::string &xml_str\)](#)
- [Config \(XMLNode xml\)](#)
- [Config \(long cfg_ptr_addr\)](#)
- [Config \(const Config &cfg\)](#)
- void [print \(void\)](#)
- bool [parse \(const char *filename\)](#)
- const std::string & [getFileName \(void\) const](#)
- void [setFileName \(const std::string &filename\)](#)
- void [save \(const char *filename\)](#)

5.72.1 Detailed Description

Configuration element - represents (sub)tree of ARC configuration. This class is intended to be used to pass configuration details to various parts of HED and external modules. Currently it's just a wrapper over XML tree. But than may change in a future, although interface should be preserved. Currently it is capable of loading XML configuration document from file. In future it will be capable of loading more user-readable format and process it into tree-like structure convenient for machine processing (XML-like). So far there are no schema and/or namespaces assigned.

5.72.2 Constructor & Destructor Documentation

5.72.2.1 Arc::Config::Config () [inline]

Creates empty XML tree

5.72.2.2 Arc::Config::Config (const char *filename)

Loads configuration document from file 'filename'

5.72.2.3 Arc::Config::Config (const std::string &xml_str) [inline]

Parse configuration document from memory

5.72.2.4 Arc::Config::Config (XMLNode *xml*) [inline]

Acquire existing XML (sub)tree. Content is not copied. Make sure XML tree is not destroyed while in use by this object.

5.72.2.5 Arc::Config::Config (long *cfg_ptr_addr*)

Copy constructor used by language bindings

5.72.2.6 Arc::Config::Config (const Config & *cfg*)

Copy constructor used by language bindings

5.72.3 Member Function Documentation**5.72.3.1 const std::string& Arc::Config::getFileName (void) const [inline]**

Gives back file name of config file or empty string if it was generated from the [XMLNode](#) subtree

5.72.3.2 bool Arc::Config::parse (const char **filename*)

Parse configuration document from file '*filename*'

5.72.3.3 void Arc::Config::print (void)

Print structure of document. For debugging purposes. Printed content is not an XML document.

5.72.3.4 void Arc::Config::save (const char **filename*)

Save to file

5.72.3.5 void Arc::Config::setFileName (const std::string & *filename*) [inline]

Set the file name of config file

The documentation for this class was generated from the following file:

- ArcConfig.h

5.73 Arc::ConfigEndpoint Class Reference

The documentation for this class was generated from the following file:

- UserConfig.h

5.74 Arc::ConfusaCertHandler Class Reference

```
#include <ConfusaCertHandler.h>
```

Public Member Functions

- [ConfusaCertHandler](#) (int keysiz, const std::string dn)
- std::string [getCertRequestB64](#) ()
- bool [createCertRequest](#) (std::string password="", std::string storedir=".")

5.74.1 Detailed Description

Wrapper around [Credential](#) handling the Confusa specifics.

5.74.2 Constructor & Destructor Documentation

5.74.2.1 Arc::ConfusaCertHandler::ConfusaCertHandler (int *keysize*, const std::string *dn*)

Create a new [ConfusaCertHandler](#) for DN dn and given keysiz Basically Confusa cert handler wraps around [Credential](#)

5.74.3 Member Function Documentation

5.74.3.1 bool Arc::ConfusaCertHandler::createCertRequest (std::string *password* = "", std::string *storedir* = ". /")

Create a new end entity certificate, with a private key encrypted with password password. Private key and certificate will be stored in directory storedir.

5.74.3.2 std::string Arc::ConfusaCertHandler::getCertRequestB64 ()

Get the certificate request managed by this confusa cert handler in base 64 encoding

The documentation for this class was generated from the following file:

- ConfusaCertHandler.h

5.75 Arc::ConfusaParserUtils Class Reference

```
#include <ConfusaParserUtils.h>
```

Static Public Member Functions

- static std::string [urlencode](#) (const std::string url)
- static std::string [urlencode_params](#) (const std::string url)
- static xmlDocPtr [get_doc](#) (const std::string xml_file)
- static void [destroy_doc](#) (xmlDocPtr doc)
- static std::string [extract_body_information](#) (const std::string html_string)
- static std::string [handle_redirect_step](#) (Arc::MCCConfig cfg, const std::string remote_url, std::string *cookies=NULL, std::multimap< std::string, std::string > *httpAttributes=NULL)
- static std::string [evaluate_path](#) (xmlDocPtr doc, const std::string xpathExpr, std::list< std::string > *contentList=NULL)

5.75.1 Detailed Description

Methods often needed in evaluation web pages from the Confusa WebSSO workflow

5.75.2 Member Function Documentation

5.75.2.1 static void Arc::ConfusaParserUtils::destroy_doc (xmlDocPtr doc) [static]

Destroy a libxml2 doc representation

5.75.2.2 static std::string Arc::ConfusaParserUtils::evaluate_path (xmlDocPtr doc, const std::string xpathExpr, std::list< std::string > * contentList = NULL) [static]

Evaluate the given xPathExpr on the document ptr. Return a string with the FIRST result if contentList is NULL. Return a string with the first result and all results, including the first one, in contentList if contentList is not null.

5.75.2.3 static std::string Arc::ConfusaParserUtils::extract_body_information (const std::string html_string) [static]

Get the part only within <body> and </body> in a HTML string For parsing, usually only this part is interesting.

5.75.2.4 static xmlDocPtr Arc::ConfusaParserUtils::get_doc (const std::string xml_file) [static]

Construct a libxml2 doc representation from the xml file

5.75.2.5 static std::string Arc::ConfusaParserUtils::handle_redirect_step (Arc::MCCConfig *cfg*, const std::string *remote_url*, std::string * *cookies* = NULL, std::multimap< std::string, std::string > * *httpAttributes* = NULL) [static]

Handle a single redirect step from the SAML2 WebSSO profile. Store the received cookie in *cookie and pass the given httpAttributes to the site during redirect.

5.75.2.6 static std::string Arc::ConfusaParserUtils::urlencode (const std::string *url*) [static]

urlencode the passed string

5.75.2.7 static std::string Arc::ConfusaParserUtils::urlencode_params (const std::string *url*) [static]

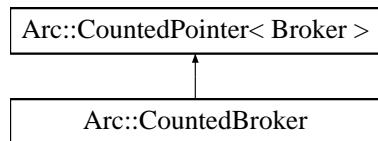

Urlencode the passed string with respect to the parameters. The difference to urlencode is that the parameters will keep their separators, i.e. the ? and & separating parameters will be preserved.

The documentation for this class was generated from the following file:

- T * **Ptr** (void) const
- T * **Release** (void)

5.77.1 Detailed Description

```
template<typename T> class Arc::CountedPointer< T >
```

Wrapper for pointer with automatic destruction and mutiple references. If ordinary pointer is wrapped in instance of this class it will be automatically destroyed when all instances refering to it are destroyed. This is useful for maintaing pointers refered from multiple structures with automatic destruction of original object when last reference is destroyed. It is similar to Java approach with a difference that desctruction time is strictly defined. Only pointers returned by new() are supported. This class is not thread-safe

The documentation for this class was generated from the following file:

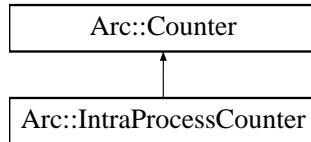

- Utils.h

5.78 Arc::Counter Class Reference

5.78.1 Detailed Description

A class defining a common interface for counters. This class defines a common interface for counters as well as some common functionality.

The purpose of a counter is to provide housekeeping some resource such as e.g. disk space, memory or network bandwidth. The counter itself will not be aware of what kind of resource it limits the use of. Neither will it be aware of what unit is being used to measure that resource. Counters are thus very similar to semaphores. Furthermore, counters are designed to handle concurrent operations from multiple threads/processes in a consistent manner.

Every counter has a limit, an excess limit and a value. The limit is a number that specify how many units are available for reservation. The value is the number of units that are currently available for reservation, i.e. has not already been reserved. The excess limit specify how many extra units can be reserved for high priority needs even if there are no normal units available for reservation. The excess limit is similar to the credit limit of e.g. a VISA card.

The users of the resource must thus first call the counter in order to make a reservation of an appropriate amount of the resource, then allocate and use the resource and finally call the counter again to cancel the reservation.

Typical usage is:

```
// Declare a counter. Replace XYZ by some appropriate kind of
// counter and provide required parameters. Unit is MB.
XYZCounter memory(...);

...
// Make a reservation of memory for 2000000 doubles.
CounterTicket tick = memory.reserve(2*sizeof(double));
// Use the memory.
double* A=new double[2000000];
doSomething(A);
delete[] A;
// Cancel the reservation.
tick.cancel();
```

There are also alternative ways to make reservations, including self-expiring reservations, prioritized reservations and reservations that fail if they cannot be made fast enough.

For self expiring reservations, a duration is provided in the reserve call:

```
tick = memory.reserve(2*sizeof(double), Glib::TimeVal(1,0));
```

A self-expiring reservation can be cancelled explicitly before it expires, but if it is not cancelled it will expire automatically when the duration has passed. The default value for the duration is ETERNAL, which means that the reservation will not be cancelled automatically.

Prioritized reservations may use the excess limit and succeed immediately even if there are no normal units available for reservation. The value of the counter will in this case become negative. A prioritized reservation looks like this:

```
tick = memory.reserve(2*sizeof(double), Glib::TimeVal(1,0), true);
```

Finally, a time out option can be provided for a reservation. If some task should be performed within two seconds or not at all, the reservation can look like this:

```
tick = memory.reserve(2*sizeof(double), Glib::TimeVal(1,0),
                     true, Glib::TimeVal(2,0));
if (tick.isValid())
    doSomething(...);
```

5.78.2 Member Typedef Documentation

5.78.2.1 `typedef unsigned long long int Arc::Counter::IDType [protected]`

A typedef of identification numbers for reservation. This is a type that is used as identification numbers (keys) for referencing of reservations. It is used internally in counters for book keeping of reservations as well as in the [CounterTicket](#) class in order to be able to cancel and extend reservations.

5.78.3 Constructor & Destructor Documentation

5.78.3.1 `Arc::Counter::Counter () [protected]`

Default constructor. This is the default constructor. Since [Counter](#) is an abstract class, it should only be used by subclasses. Therefore it is protected. Furthermore, since the [Counter](#) class has no attributes, nothing needs to be initialized and thus this constructor is empty.

5.78.3.2 `virtual Arc::Counter::~Counter () [virtual]`

The destructor. This is the destructor of the [Counter](#) class. Since the [Counter](#) class has no attributes, nothing needs to be cleaned up and thus the destructor is empty.

5.78.4 Member Function Documentation

5.78.4.1 `virtual void Arc::Counter::cancel (IDType reservationID) [protected, pure virtual]`

Cancellation of a reservation. This method cancels a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

Parameters:

reservationID The identity number (key) of the reservation to cancel.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.2 `virtual int Arc::Counter::changeExcess (int amount) [pure virtual]`

Changes the excess limit of the counter. Changes the excess limit of the counter by adding a certain amount to the current excess limit.

Parameters:

amount The amount by which to change the excess limit.

Returns:

The new excess limit.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.3 virtual int Arc::Counter::changeLimit (int *amount*) [pure virtual]

Changes the limit of the counter. Changes the limit of the counter by adding a certain amount to the current limit.

Parameters:

amount The amount by which to change the limit.

Returns:

The new limit.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.4 virtual void Arc::Counter::extend (IDType & *reservationID*, Glib::TimeVal & *expiryTime*, Glib::TimeVal *duration* = ETERNAL) [protected, pure virtual]

Extension of a reservation. This method extends a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

Parameters:

reservationID Used for input as well as output. Contains the identification number of the original reservation on entry and the new identification number of the extended reservation on exit.

expiryTime Used for input as well as output. Contains the expiry time of the original reservation on entry and the new expiry time of the extended reservation on exit.

duration The time by which to extend the reservation. The new expiration time is computed based on the current time, NOT the previous expiration time.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.5 CounterTicket Arc::Counter::getCounterTicket (Counter::IDType *reservationID*, Glib::TimeVal *expiryTime*, Counter * *counter*) [protected]

A "relay method" for a constructor of the [CounterTicket](#) class. This method acts as a relay for one of the constructors of the [CounterTicket](#) class. That constructor is private, but needs to be accessible from the subclasses of [Counter](#) (but not from anywhere else). In order not to have to declare every possible subclass of [Counter](#) as a friend of [CounterTicket](#), only the base class [Counter](#) is a friend and its subclasses access the constructor through this method. (If C++ had supported "package access", as Java does, this trick would not have been necessary.)

Parameters:

reservationID The identity number of the reservation corresponding to the [CounterTicket](#).

expiryTime the expiry time of the reservation corresponding to the [CounterTicket](#).

counter The [Counter](#) from which the reservation has been made.

Returns:

The counter ticket that has been created.

5.78.4.6 Glib::TimeVal Arc::Counter::getCurrentTime () [protected]

Get the current time. Returns the current time. An "adapter method" for the assign_current_time() method in the Glib::TimeVal class. return The current time.

5.78.4.7 virtual int Arc::Counter::getExcess () [pure virtual]

Returns the excess limit of the counter. Returns the excess limit of the counter, i.e. by how much the usual limit may be exceeded by prioritized reservations.

Returns:

The excess limit.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.8 ExpirationReminder Arc::Counter::getExpirationReminder (Glib::TimeVal *expTime*, Counter::IDType *resID*) [protected]

A "relay method" for the constructor of [ExpirationReminder](#). This method acts as a relay for one of the constructors of the [ExpirationReminder](#) class. That constructor is private, but needs to be accessible from the subclasses of [Counter](#) (but not from anywhere else). In order not to have to declare every possible subclass of [Counter](#) as a friend of [ExpirationReminder](#), only the base class [Counter](#) is a friend and its subclasses access the constructor through this method. (If C++ had supported "package access", as Java does, this trick would not have been necessary.)

Parameters:

expTime the expiry time of the reservation corresponding to the [ExpirationReminder](#).

resID The identity number of the reservation corresponding to the [ExpirationReminder](#).

Returns:

The [ExpirationReminder](#) that has been created.

5.78.4.9 Glib::TimeVal Arc::Counter::getExpiryTime (Glib::TimeVal *duration*) [protected]

Computes an expiry time. This method computes an expiry time by adding a duration to the current time.

Parameters:

duration The duration.

Returns:

The expiry time.

5.78.4.10 virtual int Arc::Counter::getLimit () [pure virtual]

Returns the current limit of the counter. This method returns the current limit of the counter, i.e. how many units can be reserved simultaneously by different threads without claiming high priority.

Returns:

The current limit of the counter.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.11 virtual int Arc::Counter::getValue () [pure virtual]

Returns the current value of the counter. Returns the current value of the counter, i.e. the number of unreserved units. Initially, the value is equal to the limit of the counter. When a reservation is made, the value is decreased. Normally, the value should never be negative, but this may happen if there are prioritized reservations. It can also happen if the limit is decreased after some reservations have been made, since reservations are never revoked.

Returns:

The current value of the counter.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.12 virtual CounterTicket Arc::Counter::reserve (int *amount* = 1, Glib::TimeVal *duration* = ETERNAL, bool *prioritized* = false, Glib::TimeVal *timeOut* = ETERNAL) [pure virtual]

Makes a reservation from the counter. This method makes a reservation from the counter. If the current value of the counter is too low to allow for the reservation, the method blocks until the reservation is possible or times out.

Parameters:

amount The amount to reserve, default value is 1.

duration The duration of a self expiring reservation, default is that it lasts forever.

prioritized Whether this reservation is prioritized and thus allowed to use the excess limit.

timeOut The maximum time to block if the value of the counter is too low, default is to allow "eternal" blocking.

Returns:

A [CounterTicket](#) that can be queried about the status of the reservation as well as for cancellations and extensions.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.13 virtual int Arc::Counter::setExcess (int *newExcess*) [pure virtual]

Sets the excess limit of the counter. This method sets a new excess limit for the counter.

Parameters:

newExcess The new excess limit, an absolute number.

Returns:

The new excess limit.

Implemented in [Arc::IntraProcessCounter](#).

5.78.4.14 virtual int Arc::Counter::setLimit (int *newLimit*) [pure virtual]

Sets the limit of the counter. This method sets a new limit for the counter.

Parameters:

newLimit The new limit, an absolute number.

Returns:

The new limit.

Implemented in [Arc::IntraProcessCounter](#).

- Counter.h

5.79 Arc::CounterTicket Class Reference

A class for "tickets" that correspond to counter reservations.

```
#include <Counter.h>
```

Public Member Functions

- [CounterTicket \(\)](#)
- [bool isValid \(\)](#)
- [void extend \(Glib::TimeVal duration\)](#)
- [void cancel \(\)](#)

Friends

- class [Counter](#)

5.79.1 Detailed Description

A class for "tickets" that correspond to counter reservations. This is a class for reservation tickets. When a reservation is made from a [Counter](#), a [ReservationTicket](#) is returned. This ticket can then be queried about the validity of a reservation. It can also be used for cancelation and extension of reservations.

Typical usage is:

```
// Declare a counter. Replace XYZ by some appropriate kind of
// counter and provide required parameters. Unit is MB.
XYZCounter memory(...);

...
// Make a reservation of memory for 2000000 doubles.
CounterTicket tick = memory.reserve(2*sizeof(double));
// Use the memory.
double* A=new double[2000000];
doSomething(A);
delete[] A;
// Cancel the reservation.
tick.cancel();
```

5.79.2 Constructor & Destructor Documentation

5.79.2.1 [Arc::CounterTicket::CounterTicket \(\)](#)

The default constructor. This is the default constructor. It creates a [CounterTicket](#) that is not valid. The ticket object that is created can later be assigned a ticket that is returned by the [reserve\(\)](#) method of a [Counter](#).

5.79.3 Member Function Documentation

5.79.3.1 [void Arc::CounterTicket::cancel \(\)](#)

Cancels a reservation. This method is called to cancel a reservation. It may be called also for self-expiring reservations, which will then be cancelled before they were originally planned to expire.

5.79.3.2 void Arc::CounterTicket::extend (Glib::TimeVal *duration*)

Extends a reservation. Extends a self-expiring reservation. In order to succeed the extension should be made before the previous reservation expires.

Parameters:

duration The time by which to extend the reservation. The new expiration time is computed based on the current time, NOT the previous expiration time.

5.79.3.3 bool Arc::CounterTicket::isValid ()

Returns the validity of a [CounterTicket](#). This method checks whether a [CounterTicket](#) is valid. The ticket was probably returned earlier by the `reserve()` method of a [Counter](#) but the corresponding reservation may have expired.

Returns:

The validity of the ticket.

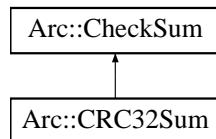

The documentation for this class was generated from the following file:

- Counter.h

5.80 Arc::CRC32Sum Class Reference

Implementation of CRC32 checksum.

```
#include <CheckSum.h>
```

Public Member Functions

- virtual void `start` (void)
- virtual void `add` (void **buf*, unsigned long long int *len*)
- virtual void `end` (void)
- virtual void `result` (unsigned char *&*res*, unsigned int &*len*) const
- virtual int `print` (char **buf*, int *len*) const
- virtual void `scan` (const char **buf*)
- virtual `operator bool` (void) const
- virtual bool `operator!` (void) const

5.80.1 Detailed Description

Implementation of CRC32 checksum. This class is a specialized class of the [CheckSum](#) class. It provides an implementation for the CRC-32 IEEE 802.3 standard.

5.80.2 Member Function Documentation

5.80.2.1 virtual void Arc::CRC32Sum::add (void * *buf*, unsigned long long int *len*) [virtual]

Add data to be checksummed. This method calculates the checksum of the passed data chuck, taking into account the previous state of this object.

Parameters:

- buf* pointer to data chuck to be checksummed.
len size of the data chuck.

Implements [Arc::CheckSum](#).

5.80.2.2 virtual void Arc::CRC32Sum::end (void) [virtual]

Finalize the checksumming. This method finalizes the checksum algorithm, that is calculating the final checksum result.

Implements [Arc::CheckSum](#).

5.80.2.3 virtual int Arc::CRC32Sum::print (char * buf, int len) const [virtual]

Retrieve result of checksum into a string. The passed string buf is filled with result of checksum algorithm in base 16. At most len characters are filled into buffer buf. The hexadecimal value is prepended with "<algorithm>:", where <algorithm> is one of "cksum", "md5" or "adler32" respectively corresponding to the result from the [CRC32Sum](#), [MD5Sum](#) and Adler32 classes.

Parameters:

buf pointer to buffer which should be filled with checksum result.
len max number of character filled into buffer.

Reimplemented from [Arc::CheckSum](#).

5.80.2.4 virtual void Arc::CRC32Sum::scan (const char * buf) [virtual]

Set internal checksum state. This method sets the internal state to that of the passed textual representation. The format passed to this method must be the same as retrieved from the [CheckSum::print](#) method.

Parameters:

buf string containing textual representation of checksum

See also:

[CheckSum::print](#)

Implements [Arc::CheckSum](#).

5.80.2.5 virtual void Arc::CRC32Sum::start (void) [virtual]

Initiate the checksum algorithm. This method must be called before starting a new checksum calculation.

Implements [Arc::CheckSum](#).

The documentation for this class was generated from the following file:

- CheckSum.h

Static Public Member Functions

- static void [InitProxyCertInfo](#) (void)
- static bool [IsCredentialsValid](#) (const [UserConfig](#) &usercfg)

5.81.1 Detailed Description

[Credential](#) class covers the functionality about general processing about certificate/key files, including:
 1. cerficate/key parsing, information extracting (such as subject name, issuer name, lifetime, etc.), chain verifying, extension processing about proxy certinfo, extension processing about other general certificate extension (such as voms attributes, it should be the extension-specific code itself to create, parse and verify the extension, not the [Credential](#) class. For voms, it is some code about writing and parsing voms-implementing Attribute Certificate/ RFC3281, the voms-attribute is then be looked as a binary part and embeded into extension of X509 certificate/proxy certificate); 2. certificate request, extension emeding and certificate signing, for both proxy certificate and EEC (end entity certificate) certificate The [Credential](#) class support PEM, DER PKCS12 credential.

5.81.2 Constructor & Destructor Documentation

5.81.2.1 [Arc::Credential::Credential \(\)](#)

Default constructor, only acts as a container for inquiring certificate request, is meaningless for any other use.

5.81.2.2 [Arc::Credential::Credential \(int keybits\)](#)

Constructor with user-defined keylength. Needed for creation of EE certs, since some applications will only support keys with a certain minimum length > 1024

5.81.2.3 Arc::Credential::Credential (const std::string & *CAfile*, const std::string & *CAkey*, const std::string & *CAserial*, const std::string & *extfile*, const std::string & *extsect*, const std::string & *passphrase4key*)

Constructor, specific constructor for CA certificate is meaningless for any other use.

5.81.2.4 Arc::Credential::Credential (Time *start*, Period *lifetime* = Period ("PT12H"), int *keybits* = 1024, std::string *proxyversion* = "rfc", std::string *policylang* = "inheritAll", std::string *policy* = "", int *pathlength* = -1)

Constructor, specific constructor for proxy certificate, only acts as a container for constraining certificate signing and/or generating certificate request(only keybits is useful for creating certificate request), is meaningless for any other use. The proxyversion and policylang is for specifying the proxy certificate type and the policy language inside proxy. The definition of proxyversion and policy language is based on http://dev.globus.org/wiki/Security/ProxyCertTypes#RFC_3820_Proxy_Certificates The code is supposed to support proxy version: GSI2(legacy proxy), GSI3(Proxy draft) and RFC(RFC3820 proxy), and correspoding policy language. GSI2(GSI2, GSI2-LIMITED) GSI3 and RFC (IMPERSONATION_PROXY--1.3.6.1.5.5.7.21.1, INDEPENDENT_PROXY--1.3.6.1.5.5.7.21.2, LIMITED_PROXY--1.3.6.1.4.1.3536.1.1.1.9, RESTRICTED_PROXY--policy language undefined) In openssl>=098, there are three types of policy languages: id-ppl-inheritAll--1.3.6.1.5.5.7.21.1, id-ppl-independent--1.3.6.1.5.5.7.21.2, and id-ppl-anyLanguage-1.3.6.1.5.5.7.21.0

Parameters:

start,start time of proxy certificate

lifetime,lifetime of proxy certificate

keybits,modulus size for RSA key generation, it should be greater than 1024 if 'this' class is used for generating X509 request; it should be '0' if 'this' class is used for constraing certificate signing.

5.81.2.5 Arc::Credential::Credential (const std::string & *cert*, const std::string & *key*, const std::string & *cadir*, const std::string & *cafile*, const std::string & *passphrase4key* = "", const bool *is_file* = true)

Constructor, specific constructor for usual certificate, constructing from credential files. only acts as a container for parsing the certificate and key files, is meaningless for any other use. this constructor will parse the credential information, and put them into "this" object

Parameters:

passphrase4key,specifies the password for descrypting private key (if needed). If value is empty then password will be asked interrctively. To avoid askig for password use value provided by NoPassword() method.

is_file,specifies if the cert/key are from file, otherwise they are supposed to be from string. default is from file

5.81.2.6 Arc::Credential::Credential (const UserConfig & *usercfg*, const std::string & *passphrase4key* = "")

Constructor, specific constructor for usual certificate, constructing from information in [UserConfig](#) object. Only acts as a container for parsing the certificate and key files, is meaningless for any other use. this constructor will parse the credential * information, and put them into "this" object

Parameters:

is_file,specify if the cert/key are from file, otherwise they are supposed to be from string. default is from file

5.81.3 Member Function Documentation**5.81.3.1 void Arc::Credential::AddCertExtObj (std::string & *sn*, std::string & *oid*)**

General method for adding a new nid into openssl's global const

5.81.3.2 bool Arc::Credential::AddExtension (const std::string & *name*, char ** *binary*)

Add an extension to the extension part of the certificate

Parameters:

binary,the data which will be inserted into certificate extension part as a specific extension there should be specific methods defined inside specific X509V3_EXT_METHOD structure to parse the specific extension format. For example, VOMS attribute certificate is a specific extension to proxy certificate. There is specific X509V3_EXT_METHOD defined in [VOMSAttribute.h](#) and [VOMSAttribute.c](#) for parsing attribute certificate. In openssl, the specific X509V3_EXT_METHOD can be got according to the extension name/id, see X509V3_EXT_get_nid(ext_nid)

5.81.3.3 bool Arc::Credential::AddExtension (const std::string & *name*, const std::string & *data*, bool *crit = false*)

Add an extension to the extension part of the certificate

Parameters:

name,the name of the extension, there OID related with the name should be registered into openssl firstly

data,the data which will be inserted into certificate extension

5.81.3.4 bool Arc::Credential::GenerateEECRequest (const char * *request_filename*, const char * *key_filename*, const std::string & *dn = ""*)

Generate an EEC request, output the certificate request and the key to a file

5.81.3.5 bool Arc::Credential::GenerateEECRequest (std::string & *reqcontent*, std::string & *keycontent*, const std::string & *dn = ""*)

Generate an EEC request, output the certificate request to a string

5.81.3.6 bool Arc::Credential::GenerateEECRequest (BIO * *reqbio*, BIO * *keybio*, const std::string & *dn = ""*)

Generate an EEC request, based on the keybits and signing algorithm information inside this object output the certificate request to output BIO

The user will be asked for a private key password

5.81.3.7 bool Arc::Credential::GenerateRequest (const char *filename, bool if_der = false)

Generate a proxy request, output the certificate request to a file

5.81.3.8 bool Arc::Credential::GenerateRequest (std::string & content, bool if_der = false)

Generate a proxy request, output the certificate request to a string

5.81.3.9 bool Arc::Credential::GenerateRequest (BIO * bio, bool if_der = false)

Generate a proxy request, base on the keybits and signing algorithm information inside this object output the certificate request to output BIO

5.81.3.10 std::string Arc::Credential::GetCAName (void) const

Get CA of the certificate attached to this object, if the certificate is an EEC, GetCAName get the same value as GetIssuerName

5.81.3.11 X509* Arc::Credential::GetCert (void) const

Get the certificate attached to this object

5.81.3.12 int Arc::Credential::GetCertNumofChain (void) const

Get the number of certificates in the certificate chain attached to this object

5.81.3.13 X509_REQ* Arc::Credential::GetCertReq (void) const

Get the certificate request, if there is any

5.81.3.14 std::string Arc::Credential::GetDN (void) const

Get the DN of the certificate attached to this object

5.81.3.15 Time Arc::Credential::GetEndTime () const

Returns validity end time of certificate or proxy

5.81.3.16 std::string Arc::Credential::GetExtension (const std::string & name)

Get the specific extension (named by the parameter) in a certificate this function is only supposed to be called after certificate and key are loaded by the constructor for usual certificate

Parameters:

name,*the* name of the extension to get

5.81.3.17 Credformat Arc::Credential::getFormat_BIO (BIO * *in*, const bool *is_file* = true) const

Get the certificate format, PEM PKCS12 or DER BIO could be memory or file, they should be processed differently.

5.81.3.18 std::string Arc::Credential::GetIdentityName (void) const

Get the Identity name of the certificate attached to this object, the result will not include proxy CN

5.81.3.19 std::string Arc::Credential::GetIssuerName (void) const

Get issuer of the certificate attached to this object

5.81.3.20 Period Arc::Credential::GetLifeTime (void) const

Returns lifetime of certificate or proxy

5.81.3.21 EVP_PKEY* Arc::Credential::GetPrivKey (void) const

Get the private key attached to this object

5.81.3.22 std::string Arc::Credential::GetProxyPolicy (void) const

Get the proxy policy attached to the "proxy certificate information" extension of the proxy certificate

5.81.3.23 EVP_PKEY* Arc::Credential::GetPubKey (void) const

Get the public key attached to this object

5.81.3.24 Time Arc::Credential::GetStartTime () const

Returns validity start time of certificate or proxy

5.81.3.25 ArcCredential::certType Arc::Credential::GetType (void) const

Get type of the certificate attached to this object

5.81.3.26 bool Arc::Credential::GetVerification (void) const [inline]

Get the verification result about certificate chain checking

5.81.3.27 static void Arc::Credential::InitProxyCertInfo (void) [static]

Initiate nid for proxy certificate extension

5.81.3.28 bool Arc::Credential::InquireRequest (const char *filename, bool if_eec = false, bool if_der = false)

Inquire the certificate request from a file

5.81.3.29 bool Arc::Credential::InquireRequest (std::string & content, bool if_eec = false, bool if_der = false)

Inquire the certificate request from a string

5.81.3.30 bool Arc::Credential::InquireRequest (BIO *reqbio, bool if_eec = false, bool if_der = false)

Inquire the certificate request from BIO, and put the request information to X509_REQ inside this object, and parse the certificate type from the PROXYCERTINFO of request' extension

Parameters:

if_der false for PEM; true for DER

5.81.3.31 static bool Arc::Credential::IsCredentialsValid (const UserConfig & usercfg) [static]

Returns true if credentials are valid. Credentials are read from locations specified in [UserConfig](#) object. This method is deprecated. [User](#) per-instance method [IsValid\(\)](#) instead.

5.81.3.32 bool Arc::Credential::IsValid (void)

Returns true if credentials are valid

5.81.3.33 void Arc::Credential::LogError (void) const

Log error information related with openssl

5.81.3.34 bool Arc::Credential::OutputCertificate (std::string & content, bool is_der = false)

Output the certificate into string

Parameters:

is_der false for PEM, true for DER

5.81.3.35 bool Arc::Credential::OutputCertificateChain (std::string & *content*, bool *is_der* = false)

Output the certificate chain into string

Parameters:

is_der false for PEM, true for DER

5.81.3.36 bool Arc::Credential::OutputPrivatekey (std::string & *content*, bool *encryption* = false, const std::string & *passphrase* = "")

Output the private key into string

Parameters:

encryption,*whether* encrypt the output private key or not

passphrase,*the* passphrase to encrypt the output private key

5.81.3.37 bool Arc::Credential::OutputPublickey (std::string & *content*)

Output the public key into string

5.81.3.38 bool Arc::Credential::SelfSignEECRequest (const std::string & *dn*, const char * *extfile*, const std::string & *extsect*, const char * *certfile*)

Self sign a certificate. This functionality is specific for creating a CA credential by using this [Credential](#) class.

Parameters:

dn the DN for the subject

extfile the configuration file which includes the extension information, typically the openssl.cnf file

extsect the section/group name for the extension, e.g. in openssl.cnf, usr_cert and v3_ca

certfile the certificate file, which contains the signed certificate

5.81.3.39 void Arc::Credential::SetLifeTime (const Period & *period*)

Set lifetime of certificate or proxy

5.81.3.40 void Arc::Credential::SetProxyPolicy (const std::string & *proxyversion*, const std::string & *policylang*, const std::string & *policy*, int *pathlength*)

Set the proxy policy attached to the "proxy certificate information" extension of the proxy certificate

5.81.3.41 void Arc::Credential::SetStartTime (const Time & *start_time*)

Set start time of certificate or proxy

5.81.3.42 bool Arc::Credential::SignEECRequest (Credential * *eec*, const std::string & *dn*, const char **filename*)

Sign request and output the signed certificate to a file

5.81.3.43 bool Arc::Credential::SignEECRequest (Credential * *eec*, const std::string & *dn*, std::string & *content*)

Sign request and output the signed certificate to a string

5.81.3.44 bool Arc::Credential::SignEECRequest (Credential * *eec*, const std::string & *dn*, BIO * *outputbio*)

Sign eec request, and output the signed certificate to output BIO

5.81.3.45 bool Arc::Credential::SignRequest (Credential * *proxy*, const char **filename*, bool *foamat = false*)

Sign request and output the signed certificate to a file

Parameters:

if_der false for PEM, true for DER

5.81.3.46 bool Arc::Credential::SignRequest (Credential * *proxy*, std::string & *content*, bool *if_der = false*)

Sign request and output the signed certificate to a string

Parameters:

if_der false for PEM, true for DER

5.81.3.47 bool Arc::Credential::SignRequest (Credential * *proxy*, BIO * *outputbio*, bool *if_der = false*)

Sign request based on the information inside proxy, and output the signed certificate to output BIO

Parameters:

if_der false for PEM, true for DER

5.81.3.48 Arc::Credential::STACK_OF (X509) const

Get the certificate chain attached to this object

The documentation for this class was generated from the following file:

- Credential.h

5.82 Arc::CredentialError Class Reference

```
#include <Credential.h>
```

Public Member Functions

- [CredentialError \(const std::string &what=""\)](#)

5.82.1 Detailed Description

This is an exception class that is used to handle runtime errors discovered in the [Credential](#) class.

5.82.2 Constructor & Destructor Documentation

5.82.2.1 Arc::CredentialError::CredentialError (const std::string & *what* = "")

This is the constructor of the [CredentialError](#) class.

Parameters:

what An explanation of the error.

The documentation for this class was generated from the following file:

- Credential.h

5.83 Arc::CredentialStore Class Reference

```
#include <CredentialStore.h>
```

5.83.1 Detailed Description

This class provides functionality for storing delegated credentials and retrieving them from some store services. This is very preliminary implementation and currently support only one type of credentials - X.509 proxies, and only one type of store service - MyProxy. Later it will be extended to support at least following services: ARC delegation service, VOMS service, local file system.

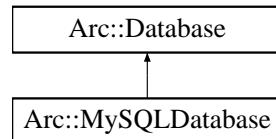

The documentation for this class was generated from the following file:

- CredentialStore.h

5.84 Arc::Database Class Reference

Interface for calling database client library.

```
#include <DBInterface.h>
```

Public Member Functions

- `Database ()`
- `Database (std::string &server, int port)`
- `Database (const Database &other)`
- `virtual ~Database ()`
- `virtual bool connect (std::string &dbname, std::string &user, std::string &password)=0`
- `virtual bool isconnected () const =0`
- `virtual void close ()=0`
- `virtual bool enable_ssl (const std::string &keyfile="", const std::string &certfile="", const std::string &cafile="", const std::string &capath "")=0`
- `virtual bool shutdown ()=0`

5.84.1 Detailed Description

Interface for calling database client library. For different types of database client library, different classes should be implemented by implementing this interface.

5.84.2 Constructor & Destructor Documentation

5.84.2.1 Arc::Database::Database () [inline]

Default constructor

5.84.2.2 Arc::Database::Database (std::string & *server*, int *port*) [inline]

Constructor which uses the server's name(or IP address) and port as parameters

5.84.2.3 Arc::Database::Database (const Database & *other*) [inline]

Copy constructor

5.84.2.4 virtual Arc::Database::~Database () [inline, virtual]

Deconstructor

5.84.3 Member Function Documentation

5.84.3.1 virtual void Arc::Database::close () [pure virtual]

Close the connection with database server

Implemented in [Arc::MySQLDatabase](#).

5.84.3.2 virtual bool Arc::Database::connect (std::string & *dbname*, std::string & *user*, std::string & *password*) [pure virtual]

Do connection with database server

Parameters:

dbname The database name which will be used.

user The username which will be used to access database.

password The password which will be used to access database.

Implemented in [Arc::MySQLDatabase](#).

5.84.3.3 virtual bool Arc::Database::enable_ssl (const std::string & *keyfile* = "", const std::string & *certfile* = "", const std::string & *cafile* = "", const std::string & *capath* = "") [pure virtual]

Enable ssl communication for the connection

Parameters:

keyfile The location of key file.

certfile The location of certificate file.

cafile The location of ca file.

capath The location of ca directory

Implemented in [Arc::MySQLDatabase](#).

5.84.3.4 virtual bool Arc::Database::isconnected () const [pure virtual]

Get the connection status

Implemented in [Arc::MySQLDatabase](#).

5.84.3.5 virtual bool Arc::Database::shutdown () [pure virtual]

Ask database server to shutdown

Implemented in [Arc::MySQLDatabase](#).

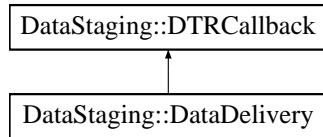

The documentation for this class was generated from the following file:

- DBInterface.h

5.85 DataStaging::DataDelivery Class Reference

[DataDelivery](#) transfers data between specified physical locations.

```
#include <DataDelivery.h>Inheritance diagram for DataStaging::DataDelivery::
```

Public Member Functions

- [DataDelivery \(\)](#)
- [~DataDelivery \(\)](#)
- virtual void [receiveDTR \(DTR_ptr request\)](#)
- bool [cancelDTR \(DTR_ptr request\)](#)
- bool [start \(\)](#)
- bool [stop \(\)](#)
- void [SetTransferParameters \(const TransferParameters ¶ms\)](#)

5.85.1 Detailed Description

[DataDelivery](#) transfers data between specified physical locations. All meta-operations for a [DTR](#) such as resolving replicas must be done before sending to [DataDelivery](#). Calling [receiveDTR\(\)](#) starts a new process which performs data transfer as specified in [DTR](#).

5.85.2 Member Function Documentation

5.85.2.1 virtual void DataStaging::DataDelivery::receiveDTR (DTR_ptr request) [virtual]

Pass a [DTR](#) to Delivery. This method is called by the scheduler to pass a [DTR](#) to the delivery. The [DataDelivery](#) starts a process to do the processing, and then returns. DataDelivery's own thread then monitors the started process.

Implements [DataStaging::DTRCallback](#).

The documentation for this class was generated from the following file:

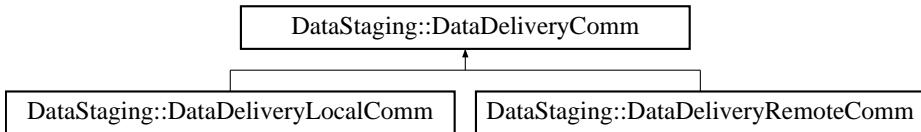

- DataDelivery.h

5.86 DataStaging::DataDeliveryComm Class Reference

This class provides an abstract interface for the Delivery layer.

```
#include <DataDeliveryComm.h>
```

Inheritance diagram for DataStaging::DataDeliveryComm::

Data Structures

- struct [Status](#)

Plain C struct to pass information from executing process back to main thread.

Public Types

- enum [CommStatusType](#) {
 [CommInit](#), [CommNoError](#), [CommTimeout](#), [CommClosed](#),
[CommExited](#), [CommFailed](#) }

Public Member Functions

- static bool [CheckComm](#) ([DTR_ptr](#) dtr, std::vector< std::string > &allowed_dirs)

Protected Member Functions

- virtual void [PullStatus](#) ()=0
- [DataDeliveryComm](#) ([DTR_ptr](#) dtr, const [TransferParameters](#) ¶ms)

Protected Attributes

- [Status status_](#)
- [Status status_buf_](#)
- unsigned int [status_pos_](#)

- Glib::Mutex `lock_`
- `DataDeliveryCommHandler * handler_`
- std::string `dtr_id`
- `TransferParameters transfer_params`
- `Arc::Time start_`
- `DTRLogger logger_`

5.86.1 Detailed Description

This class provides an abstract interface for the Delivery layer. Different implementations provide different ways of providing Delivery functionality. `DataDeliveryLocalComm` launches a local process to perform the transfer and `DataDeliveryRemoteComm` contacts a remote service which performs the transfer. The implementation is chosen depending on what is set in the `DTR`, which the `Scheduler` should set based on various factors.

`CreateInstance()` should be used to get a pointer to the instantiated object. This also starts the transfer. Deleting this object stops the transfer and cleans up any used resources. A singleton instance of `DataDeliveryCommHandler` regularly polls all active transfers using `PullStatus()` and fills the `Status` object with current information, which can be obtained through `GetStatus()`.

5.86.2 Member Enumeration Documentation

5.86.2.1 enum DataStaging::DataDeliveryComm::CommStatusType

Communication status with transfer.

Enumerator:

- `CommInit` Initializing/starting transfer, rest of information not valid.
- `CommNoError` Communication going on smoothly.
- `CommTimeout` Communication experienced timeout.
- `CommClosed` Communication channel was closed.
- `CommExited` Transfer exited. Mostly same as CommClosed but exit detected before pipe closed.
- `CommFailed` Transfer failed. If we have CommFailed and no error code reported that normally means segfault or external kill.

5.86.3 Constructor & Destructor Documentation

5.86.3.1 DataStaging::DataDeliveryComm::DataDeliveryComm (DTR_ptr `dtr`, const `TransferParameters & params`) [protected]

Start transfer with parameters taken from `DTR` and supplied transfer limits. Constructor should not be used directly, `CreateInstance()` should be used instead.

5.86.4 Member Function Documentation

5.86.4.1 static bool DataStaging::DataDeliveryComm::CheckComm (DTR_ptr `dtr`, std::vector<std::string > & `allowed_dirs`) [static]

Check the delivery is available. Calls CheckComm of the appropriate subclass.

Parameters:

dtr DTR from which credentials are used

allowed_dirs List of dirs that this comm is allowed to read/write

Reimplemented in [DataStaging::DataDeliveryLocalComm](#), and [DataStaging::DataDeliveryRemoteComm](#).

5.86.4.2 virtual void DataStaging::DataDeliveryComm::PullStatus () [protected, pure virtual]

Check for new state and fill state accordingly. This method is periodically called by the comm handler to obtain status info. It detects communication and delivery failures and delivery termination.

Implemented in [DataStaging::DataDeliveryLocalComm](#), and [DataStaging::DataDeliveryRemoteComm](#).

The documentation for this class was generated from the following file:

- [DataDeliveryComm.h](#)

5.87 DataStaging::DataDeliveryCommHandler Class Reference

Singleton class handling all active [DataDeliveryComm](#) objects.

```
#include <DataDeliveryComm.h>
```

Public Member Functions

- void [Add](#) ([DataDeliveryComm](#) *item)
- void [Remove](#) ([DataDeliveryComm](#) *item)

Static Public Member Functions

5.93 Arc::DelegationConsumer Class Reference

#include <DelegationInterface.h> Inheritance diagram for Arc::DelegationConsumer::

Public Member Functions

- [DelegationConsumer](#) (void)
- [DelegationConsumer](#) (const std::string &content)
- const std::string & [ID](#) (void)
- bool [Backup](#) (std::string &content)
- bool [Restore](#) (const std::string &content)
- bool [Request](#) (std::string &content)
- bool [Acquire](#) (std::string &content)
- bool [Acquire](#) (std::string &content, std::string &identity)

Protected Member Functions

- bool [Generate](#) (void)
- void [LogError](#) (void)

5.93.1 Detailed Description

A consumer of delegated X509 credentials. During delegation procedure this class acquires delegated credentials aka proxy - certificate, private key and chain of previous certificates. Delegation procedure consists of calling [Request\(\)](#) method for generating certificate request followed by call to [Acquire\(\)](#) method for making complete credentials from certificate chain.

5.93.2 Constructor & Destructor Documentation

5.93.2.1 Arc::DelegationConsumer::DelegationConsumer (void)

Creates object with new private key

5.93.2.2 Arc::DelegationConsumer::DelegationConsumer (const std::string & content)

Creates object with provided private key

5.93.3 Member Function Documentation

5.93.3.1 bool Arc::DelegationConsumer::Acquire (std::string & content, std::string & identity)

Includes the functionality of Acquire(content) plus extracting the credential identity.

5.93.3.2 bool Arc::DelegationConsumer::Acquire (std::string & *content*)

Ads private key into certificates chain in 'content' On exit content contains complete delegated credentials.

5.93.3.3 bool Arc::DelegationConsumer::Backup (std::string & *content*)

Stores content of this object into a string

5.93.3.4 bool Arc::DelegationConsumer::Generate (void) [protected]

Private key

5.93.3.5 const std::string& Arc::DelegationConsumer::ID (void)

Return identifier of this object - not implemented

5.93.3.6 void Arc::DelegationConsumer::LogError (void) [protected]

Creates private key

5.93.3.7 bool Arc::DelegationConsumer::Request (std::string & *content*)

Make X509 certificate request from internal private key

5.93.3.8 bool Arc::DelegationConsumer::Restore (const std::string & *content*)

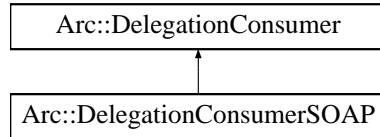

Restores content of object from string

The documentation for this class was generated from the following file:

- DelegationInterface.h

5.94 Arc::DelegationConsumerSOAP Class Reference

#include <DelegationInterface.h>Inheritance diagram for Arc::DelegationConsumerSOAP:::

Public Member Functions

- [DelegationConsumerSOAP \(void\)](#)
- [DelegationConsumerSOAP \(const std::string &content\)](#)
- bool [DelegateCredentialsInit \(const std::string &id, const SOAPEnvelope &in, SOAPEnvelope &out\)](#)
- bool [UpdateCredentials \(std::string &credentials, const SOAPEnvelope &in, SOAPEnvelope &out\)](#)
- bool [UpdateCredentials \(std::string &credentials, std::string &identity, const SOAPEnvelope &in, SOAPEnvelope &out\)](#)
- bool [DelegatedToken \(std::string &credentials, XMLNode token\)](#)

5.94.1 Detailed Description

This class extends [DelegationConsumer](#) to support SOAP message exchange. Implements WS interface <http://www.nordugrid.org/schemas/delegation> described in delegation.wsdl.

5.94.2 Constructor & Destructor Documentation

5.94.2.1 Arc::DelegationConsumerSOAP::DelegationConsumerSOAP (void)

Creates object with new private key

5.94.2.2 Arc::DelegationConsumerSOAP::DelegationConsumerSOAP (const std::string & content)

Creates object with specified private key

5.94.3 Member Function Documentation

5.94.3.1 bool Arc::DelegationConsumerSOAP::DelegateCredentialsInit (const std::string & id, const SOAPEnvelope & in, SOAPEnvelope & out)

Process SOAP message which starts delegation. Generated message in 'out' is meant to be sent back to DelagationProviderSOAP. Argument 'id' contains identifier of procedure and is used only to produce SOAP message.

5.94.3.2 bool Arc::DelegationConsumerSOAP::DelegatedToken (std::string & *credentials*, XMLNode *token*)

Similar to UpdateCredentials but takes only DelegatedToken XML element

5.94.3.3 bool Arc::DelegationConsumerSOAP::UpdateCredentials (std::string & *credentials*, std::string & *identity*, const SOAPEnvelope & *in*, SOAPEnvelope & *out*)

Includes the functionality in above UpdateCredentials method; plus extracting the credential identity

5.94.3.4 bool Arc::DelegationConsumerSOAP::UpdateCredentials (std::string & *credentials*, const SOAPEnvelope & *in*, SOAPEnvelope & *out*)

Accepts delegated credentials. Process 'in' SOAP message and stores full proxy credentials in 'credentials'. 'out' message is generated for sending to DelagationProviderSOAP.

The documentation for this class was generated from the following file:

- DelegationInterface.h

5.95 Arc::DelegationContainerSOAP Class Reference

```
#include <DelegationInterface.h>
```

Public Member Functions

- bool [DelegatedToken](#) (std::string &credentials, [XMLNode](#) token, const std::string &client="")

Protected Member Functions

- virtual [DelegationConsumerSOAP](#) * [AddConsumer](#) (std::string &id, const std::string &client)
- virtual [DelegationConsumerSOAP](#) * [FindConsumer](#) (const std::string &id, const std::string &client)
- virtual bool [TouchConsumer](#) ([DelegationConsumerSOAP](#) *c, const std::string &credentials)
- virtual bool [QueryConsumer](#) ([DelegationConsumerSOAP](#) *c, std::string &credentials)
- virtual void [ReleaseConsumer](#) ([DelegationConsumerSOAP](#) *c)
- virtual void [RemoveConsumer](#) ([DelegationConsumerSOAP](#) *c)
- virtual void [CheckConsumers](#) (void)
- bool [DelegateCredentialsInit](#) (const SOAPEnvelope &in, SOAPEnvelope &out, const std::string &client="")
- bool [UpdateCredentials](#) (std::string &credentials, const SOAPEnvelope &in, SOAPEnvelope &out, const std::string &client="")

Protected Attributes

- int [max_size_](#)
- int [max_duration_](#)
- int [max_usage_](#)
- bool [context_lock_](#)

5.95.1 Detailed Description

Manages multiple delegated credentials. Delegation consumers are created automatically with [DelegateCredentialsInit](#) method up to [max_size_](#) and assigned unique identifier. Its methods are similar to those of [DelegationConsumerSOAP](#) with identifier included in SOAP message used to route execution to one of managed [DelegationConsumerSOAP](#) instances.

5.95.2 Member Function Documentation

5.95.2.1 virtual [DelegationConsumerSOAP](#)* [Arc::DelegationContainerSOAP::AddConsumer](#) (std::string & id, const std::string & client) [protected, virtual]

Creates new consumer object, if empty assigns id and stores in internal store

5.95.2.2 virtual void [Arc::DelegationContainerSOAP::CheckConsumers](#) (void) [protected, virtual]

Periodic management of stored consumers

5.95.2.3 bool Arc::DelegationContainerSOAP::DelegateCredentialsInit (const SOAPEnvelope & *in*, SOAPEnvelope & *out*, const std::string & *client* = "") [protected]

See [DelegationConsumerSOAP::DelegateCredentialsInit](#) If 'client' is not empty then all subsequent calls involving access to generated credentials must contain same value in their 'client' arguments.

5.95.2.4 bool Arc::DelegationContainerSOAP::DelegatedToken (std::string & *credentials*, XMLNode *token*, const std::string & *client* = "")

See [DelegationConsumerSOAP::DelegatedToken](#)

5.95.2.5 virtual DelegationConsumerSOAP* Arc::DelegationContainerSOAP::FindConsumer (const std::string & *id*, const std::string & *client*) [protected, virtual]

Finds previously created consumer in internal store

5.95.2.6 virtual bool Arc::DelegationContainerSOAP::QueryConsumer (DelegationConsumerSOAP * *c*, std::string & *credentials*) [protected, virtual]

Obtain stored credentials - not all containers may provide this functionality

5.95.2.7 virtual void Arc::DelegationContainerSOAP::ReleaseConsumer (DelegationConsumerSOAP * *c*) [protected, virtual]

Releases consumer obtained by call to [AddConsumer\(\)](#) or [FindConsumer\(\)](#)

5.95.2.8 virtual void Arc::DelegationContainerSOAP::RemoveConsumer (DelegationConsumerSOAP * *c*) [protected, virtual]

Releases consumer obtained by call to [AddConsumer\(\)](#) or [FindConsumer\(\)](#) and deletes it

5.95.2.9 virtual bool Arc::DelegationContainerSOAP::TouchConsumer (DelegationConsumerSOAP * *c*, const std::string & *credentials*) [protected, virtual]

Marks consumer as recently used and acquire new credentials

5.95.2.10 bool Arc::DelegationContainerSOAP::UpdateCredentials (std::string & *credentials*, const SOAPEnvelope & *in*, SOAPEnvelope & *out*, const std::string & *client* = "") [protected]

See [DelegationConsumerSOAP::UpdateCredentials](#)

5.95.3 Field Documentation

5.95.3.1 bool Arc::DelegationContainerSOAP::context_lock_ [protected]

If true delegation consumer is deleted when connection context is destroyed

5.95.3.2 int Arc::DelegationContainerSOAP::max_duration_ [protected]

Lifetime of unused delegation consumer

5.95.3.3 int Arc::DelegationContainerSOAP::max_size_ [protected]

Max. number of delegation consumers

5.95.3.4 int Arc::DelegationContainerSOAP::max_usage_ [protected]

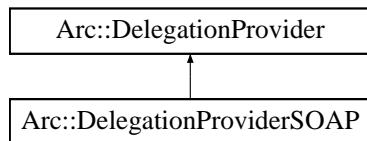

Max. times same delegation consumer may accept credentials

The documentation for this class was generated from the following file:

5.96 Arc::DelegationProvider Class Reference

#include <DelegationInterface.h> Inheritance diagram for Arc::DelegationProvider::

Public Member Functions

- [DelegationProvider](#) (const std::string &credentials)
- [DelegationProvider](#) (const std::string &cert_file, const std::string &key_file, std::istream *inpwd=NULL)
- std::string [Delegate](#) (const std::string &request, const DelegationRestrictions &restrictions=DelegationRestrictions())

5.96.1 Detailed Description

A provider of delegated credentials. During delegation procedure this class generates new credential to be used in proxy/delegated credential.

5.96.2 Constructor & Destructor Documentation

5.96.2.1 Arc::DelegationProvider::DelegationProvider (const std::string & credentials)

Creates instance from provided credentials. Credentials are used to sign delegated credentials. Arguments should contain PEM-encoded certificate, private key and optionally certificates chain.

5.96.2.2 Arc::DelegationProvider::DelegationProvider (const std::string & cert_file, const std::string & key_file, std::istream * inpwd = NULL)

Creates instance from provided credentials. Credentials are used to sign delegated credentials. Arguments should contain filesystem path to PEM-encoded certificate and private key. Optionally cert_file may contain certificates chain.

5.96.3 Member Function Documentation

5.96.3.1 std::string Arc::DelegationProvider::Delegate (const std::string & request, const DelegationRestrictions & restrictions = DelegationRestrictions())

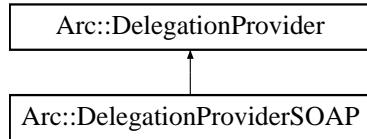

Perform delegation. Takes X509 certificate request and creates proxy credentials excluding private key. Result is then to be fed into [DelegationConsumer::Acquire](#)

The documentation for this class was generated from the following file:

- DelegationInterface.h

5.97 Arc::DelegationProviderSOAP Class Reference

#include <DelegationInterface.h> Inheritance diagram for Arc::DelegationProviderSOAP::

Public Member Functions

- [DelegationProviderSOAP](#) (const std::string &cert_file, const std::string &key_file, std::istream *inpwd=NULL)
- bool [DelegateCredentialsInit](#) (MCCInterface &mcc_interface, MessageContext *context, ServiceType stype=ARCDelegation)
- bool [DelegateCredentialsInit](#) (MCCInterface &mcc_interface, MessageAttributes *attributes_in, MessageAttributes *attributes_out, MessageContext *context, ServiceType stype=ARCDelegation)
- bool [UpdateCredentials](#) (MCCInterface &mcc_interface, MessageContext *context, const DelegationRestrictions &restrictions=DelegationRestrictions(), ServiceType stype=ARCDelegation)
- bool [UpdateCredentials](#) (MCCInterface &mcc_interface, MessageAttributes *attributes_in, MessageAttributes *attributes_out, MessageContext *context, const DelegationRestrictions &restrictions=DelegationRestrictions(), ServiceType stype=ARCDelegation)
- bool [DelegatedToken](#) (XMLNode parent)
- const std::string & [ID](#) (void)

5.97.1 Detailed Description

Extension of [DelegationProvider](#) with SOAP exchange interface. This class is also a temporary container for intermediate information used during delegation procedure.

5.97.2 Constructor & Destructor Documentation

5.97.2.1 Arc::DelegationProviderSOAP::DelegationProviderSOAP (const std::string & credentials)

Creates instance from provided credentials. Credentials are used to sign delegated credentials.

5.97.2.2 Arc::DelegationProviderSOAP::DelegationProviderSOAP (const std::string & cert_file, const std::string & key_file, std::istream * inpwd = NULL)

Creates instance from provided credentials. Credentials are used to sign delegated credentials. Arguments should contain filesystem path to PEM-encoded certificate and private key. Optionally cert_file may contain certificates chain.

5.97.3 Member Function Documentation

5.97.3.1 bool Arc::DelegationProviderSOAP::DelegateCredentialsInit (MCCIInterface & *mcc_interface*, MessageAttributes * *attributes_in*, MessageAttributes * *attributes_out*, MessageContext * *context*, ServiceType *stype* = ARCDelegation)

Extended version of DelegateCredentialsInit(MCCIInterface&,MessageContext*). Additionally takes attributes for request and response message to make fine control on message processing possible.

5.97.3.2 bool Arc::DelegationProviderSOAP::DelegateCredentialsInit (MCCIInterface & *mcc_interface*, MessageContext * *context*, ServiceType *stype* = ARCDelegation)

Performs DelegateCredentialsInit SOAP operation. As result request for delegated credentials is received by this instance and stored internally. Call to UpdateCredentials should follow.

5.97.3.3 bool Arc::DelegationProviderSOAP::DelegatedToken (XMLNode *parent*)

Generates DelegatedToken element. Element is created as child of provided XML element and contains structure described in delegation.wsdl.

5.97.3.4 const std::string& Arc::DelegationProviderSOAP::ID (void) [inline]

Returns the identifier provided by service accepting delegated credentials. This identifier may then be used to refer to credentials stored at service.

5.97.3.5 bool Arc::DelegationProviderSOAP::UpdateCredentials (MCCIInterface & *mcc_interface*, MessageAttributes * *attributes_in*, MessageAttributes * *attributes_out*, MessageContext * *context*, const DelegationRestrictions & *restrictions* = DelegationRestrictions(), ServiceType *stype* = ARCDelegation)

Extended version of UpdateCredentials(MCCIInterface&,MessageContext*). Additionally takes attributes for request and response message to make fine control on message processing possible.

5.97.3.6 bool Arc::DelegationProviderSOAP::UpdateCredentials (MCCIInterface & *mcc_interface*, MessageContext * *context*, const DelegationRestrictions & *restrictions* = DelegationRestrictions(), ServiceType *stype* = ARCDelegation)

Performs UpdateCredentials SOAP operation. This concludes delegation procedure and passes delegatated credentials to [DelegationConsumerSOAP](#) instance.

5.98 ArcSec::DenyOverridesCombiningAlg Class Reference

Implement the "Deny-Overrides" algorithm.

#include <DenyOverridesAlg.h> Inheritance diagram for ArcSec::DenyOverridesCombiningAlg::

Public Member Functions

- virtual Result [combine \(EvaluationCtx *ctx, std::list< Policy * > policies\)](#)
- virtual const std::string & [getalgId \(void\) const](#)

5.98.1 Detailed Description

Implement the "Deny-Overrides" algorithm. Deny-Overrides, scans the policy set which is given as the parameters of "combine" method, if gets "deny" result from any policy, then stops scanning and gives "deny" as result, otherwise gives "permit".

5.98.2 Member Function Documentation

5.98.2.1 virtual Result ArcSec::DenyOverridesCombiningAlg::combine (EvaluationCtx * *ctx*, std::list< Policy * > *policies*) [virtual]

If there is one policy which return negative evaluation result, then omit the other policies and return DECISION_DENY

Parameters:

ctx This object contains request information which will be used to evaluated against policy.

policies This is a container which contains policy objects.

Returns:

The combined result according to the algorithm.

Implements [ArcSec::CombiningAlg](#).

5.98.2.2 virtual const std::string& ArcSec::DenyOverridesCombiningAlg::getalgId (void) const [inline, virtual]

Get the identifier

Implements [ArcSec::CombiningAlg](#).

The documentation for this class was generated from the following file:

- DenyOverridesAlg.h

5.99 Arc::DiskSpaceRequirementType Class Reference

Data Fields

- `Range< int > DiskSpace`
- `int CacheDiskSpace`
- `int SessionDiskSpace`

5.99.1 Field Documentation

5.99.1.1 int Arc::DiskSpaceRequirementType::CacheDiskSpace

Specifies the required size of cache which must be available to the job in mega-bytes (MB). A negative value undefines this attribute

5.99.1.2 Range<int> Arc::DiskSpaceRequirementType::DiskSpace

Specifies the required size of disk space which must be available to the job in mega-bytes (MB). A negative value undefines this attribute

5.99.1.3 int Arc::DiskSpaceRequirementType::SessionDiskSpace

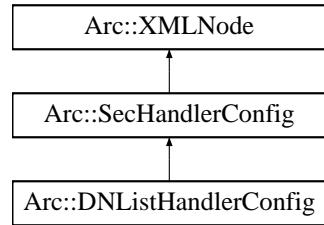

Specifies the required size of job session disk space which must be available to the job in mega-byte (MB). A negative value undefines this attribute.

5.101.1 Detailed Description

Data Transfer Request. DTR stands for Data Transfer Request and a DTR describes a data transfer between two endpoints, a source and a destination. There are several parameters and options relating to the transfer contained in a DTR. The normal workflow is for a Generator to create a DTR and send it to the Scheduler for processing using dtr.push(SCHEUDLER). If the Generator is a subclass of DTRCallback, when the Scheduler has finished with the DTR the receiveDTR() callback method is called.

DTRs should always be used through the ThreadedPointer DTR_ptr. This ensures proper memory management when passing DTRs among various threads. To enforce this policy the copy constructor and assignment operator are private.

registerCallback(this,DataStaging::GENERATOR) can be used to activate the callback. The following simple Generator code sample illustrates how to use DTRs:

```
class MyGenerator : public DTRCallback {
public:
    void receiveDTR(DTR_ptr dtr);
    void run();
private:
    Arc::SimpleCondition cond;
};

void MyGenerator::receiveDTR(DTR_ptr dtr) {
    // DTR received back, so notify waiting condition
    std::cout << "Received DTR " << dtr->get_id() << std::endl;
    cond.signal();
}

void MyGenerator::run() {
    // start Scheduler thread
    Scheduler scheduler;
    scheduler.start();

    // create a DTR
    DTR_ptr dtr(new DTR(source, destination,...));

    // register this callback
    dtr->registerCallback(this,DataStaging::GENERATOR);
    // this line must be here in order to pass the DTR to the Scheduler
    dtr->registerCallback(&scheduler,DataStaging::SCHEUDLER);

    // push the DTR to the Scheduler
    DataStaging::DTR::push(dtr, DataStaging::SCHEUDLER);

    // wait until callback is called
    cond.wait();
    // DTR is finished, so stop Scheduler
    scheduler.stop();
}
```

A lock protects member variables that are likely to be accessed and modified by multiple threads.

5.101.2 Constructor & Destructor Documentation

5.101.2.1 DataStaging::DTR::DTR (const std::string & *source*, const std::string & *destination*, const Arc::UserConfig & *usercfg*, const std::string & *jobid*, const uid_t & *uid*, DTRLLogger *log*)

Normal constructor. Construct a new [DTR](#).

Parameters:

source Endpoint from which to read data

destination Endpoint to which to write data

usercfg Provides some user configuration information

jobid ID of the job associated with this data transfer

uid UID to use when accessing local file system if source or destination is a local file. If this is different to the current uid then the current uid must have sufficient privileges to change uid.

log ThreadedPointer containing log object. If NULL the root logger is used.

5.101.3 Member Function Documentation

5.101.3.1 void DataStaging::DTR::add_problematic_delivery_service (const Arc::URL & *endpoint*) [inline]

Add problematic endpoint. Should only be those endpoints where there is a problem with the service itself and not the transfer.

5.101.3.2 void DataStaging::DTR::registerCallback (DTRCallback * *cb*, StagingProcesses *owner*)

Register callback objects to be used during [DTR](#) processing. Objects deriving from [DTRCallback](#) can be registered with this method. The callback method of these objects will then be called when the [DTR](#) is passed to the specified owner. Protected by lock.

5.101.3.3 void DataStaging::DTR::reset ()

Reset information held on this [DTR](#), such as resolved replicas, error state etc. Useful when a failed [DTR](#) is to be retried.

5.101.3.4 void DataStaging::DTR::set_error_status (DTRErrorStatus::DTRErrorStatusType *error_stat*, DTRErrorStatus::DTRErrorLocation *error_loc*, const std::string & *desc* = "")

Set the error status. The [DTRErrorStatus](#) last error state field is set to the current status of the [DTR](#). Protected by lock.

The documentation for this class was generated from the following file:

- DTR.h

5.102 DataStaging::DTRCacheParameters Class Reference

The configured cache directories.

```
#include <DTR.h>
```

Public Member Functions

- [DTRCacheParameters \(void\)](#)
- [DTRCacheParameters \(std::vector< std::string > caches, std::vector< std::string > remote_caches, std::vector< std::string > drain_caches\)](#)

Data Fields

- std::vector< std::string > [cache_dirs](#)
- std::vector< std::string > [remote_cache_dirs](#)
- std::vector< std::string > [drain_cache_dirs](#)

5.102.1 Detailed Description

The configured cache directories.

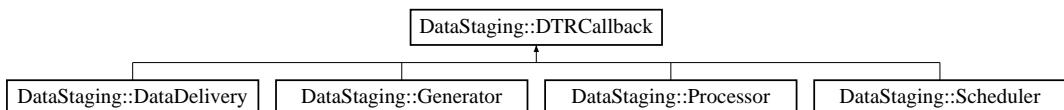

The documentation for this class was generated from the following file:

- DTR.h

5.103 DataStaging::DTRCallback Class Reference

The base class from which all callback-enabled classes should be derived.

```
#include <DTR.h>
```

Public Member Functions

- virtual ~[DTRCallback](#) ()
- virtual void [receiveDTR \(DTR_ptr dtr\)=0](#)

5.103.1 Detailed Description

The base class from which all callback-enabled classes should be derived. This class is a container for a callback method which is called when a [DTR](#) is to be passed to a component. Several components in data staging (eg [Scheduler](#), [Generator](#)) are subclasses of [DTRCallback](#), which allows them to receive DTRs through the callback system.

5.103.2 Constructor & Destructor Documentation

5.103.2.1 virtual DataStaging::DTRCallback::~DTRCallback () [inline, virtual]

Empty virtual destructor

5.103.3 Member Function Documentation

5.103.3.1 virtual void DataStaging::DTRCallback::receiveDTR (DTR_ptr dtr) [pure virtual]

Defines the callback method called when a [DTR](#) is pushed to this object. The automatic memory management of [DTR_ptr](#) ensures that the [DTR](#) object is only deleted when the last copy is deleted.

Implemented in [DataStaging::DataDelivery](#), [DataStaging::Generator](#), [DataStaging::Processor](#), and [DataStaging::Scheduler](#).

The documentation for this class was generated from the following file:

- [DTR.h](#)

5.104 DataStaging::DTRErrorStatus Class Reference

A class to represent error states reported by various components.

```
#include <DTRErrorStatus.h>
```

Public Types

- enum DTRErrorStatusType {
 NONE_ERROR, INTERNAL_LOGIC_ERROR, INTERNAL_PROCESS_ERROR, SELF_REPLICATION_ERROR,
 CACHE_ERROR, TEMPORARY_REMOTE_ERROR, PERMANENT_REMOTE_ERROR,
 LOCAL_FILE_ERROR,
 TRANSFER_SPEED_ERROR, STAGING_TIMEOUT_ERROR }
- enum DTRErrorLocation {
 NO_ERROR_LOCATION, ERROR_SOURCE, ERROR_DESTINATION, ERROR_TRANSFER,
 ERROR_UNKNOWN }

Public Member Functions

- DTRErrorStatus (DTRErrorStatusType status, DTRStatus::DTRErrorStatusType error_state, DTRErrorLocation location, const std::string &desc="")
- DTRErrorStatus ()
- DTRErrorStatusType GetErrorStatus () const
- DTRStatus::DTRErrorStatusType GetLastErrorState () const
- DTRErrorLocation GetErrorLocation () const
- std::string GetDesc () const
- bool operator==(const DTRErrorStatusType &s) const
- bool operator==(const DTRErrorStatus &s) const
- bool operator!=(const DTRErrorStatusType &s) const
- bool operator!=(const DTRErrorStatus &s) const
- DTRErrorStatus & operator=(const DTRErrorStatusType &s)

5.104.1 Detailed Description

A class to represent error states reported by various components.

5.104.2 Member Enumeration Documentation

5.104.2.1 enum DataStaging::DTRErrorStatus::DTRErrorLocation

Describes where the error occurred.

Enumerator:

- NO_ERROR_LOCATION** No error.
- ERROR_SOURCE** Error with source.
- ERROR_DESTINATION** Error with destination.

ERROR_TRANSFER Error during transfer not directly related to source or destination.

ERROR_UNKNOWN Error occurred in an unknown location.

5.104.2.2 enum DataStaging::DTRErrorStatus::DTRErrorStatusType

A list of error types.

Enumerator:

NONE_ERROR No error.

INTERNAL_LOGIC_ERROR Internal error in Data Staging logic.

INTERNAL_PROCESS_ERROR Internal processing error, like losing contact with external process.

SELF_REPLICATION_ERROR Attempt to replicate a file to itself.

CACHE_ERROR Permanent error with cache.

TEMPORARY_REMOTE_ERROR Temporary error with remote service.

PERMANENT_REMOTE_ERROR Permanent error with remote service.

LOCAL_FILE_ERROR Error with local file.

TRANSFER_SPEED_ERROR Transfer rate was too slow.

STAGING_TIMEOUT_ERROR Waited for too long to become staging.

The documentation for this class was generated from the following file:

- DTRStatus.h

5.105 DataStaging::DTRLList Class Reference

Global list of all active DTRs in the system.

```
#include <DTRLList.h>
```

Public Member Functions

- bool `add_dtr (DTR_ptr DTRToAdd)`
- bool `delete_dtr (DTR_ptr DTRToDelete)`

- void `caching_started (DTR_ptr request)`
- void `caching_finished (DTR_ptr request)`
- bool `is_being_cached (DTR_ptr DTRToCheck)`
- bool `empty ()`
- std::list< std::string > `all_jobs ()`
- void `dumpState (const std::string &path)`

5.105.1 Detailed Description

Global list of all active DTRs in the system. This class contains several methods for filtering the list by owner, state etc

5.105.2 Member Function Documentation

5.105.2.1 void DataStaging::DTRLList::dumpState (const std::string & path)

Dump state of all current DTRs to a destination, eg file, database, url... Currently only file is supported.

Parameters:

path Path to the file in which to dump state.

5.105.2.2 bool DataStaging::DTRLList::filter_dtrs_by_job (const std::string & jobid, std::list< DTR_ptr > & FilteredList)

Get the list of DTRs corresponding to the given job ID.

Parameters:

FilteredList This list is filled with filtered DTRs

**5.105.2.3 bool DataStaging::DTRLList::filter_dtrs_by_next_receiver (StagingProcesses
NextReceiver, std::list< DTR_ptr > & FilteredList)**

Select DTRs that are about to go to the specified process. This selection is actually a virtual queue for pre-, post-processor and delivery.

Parameters:

FilteredList This list is filled with filtered DTRs

**5.105.2.4 bool DataStaging::DTRLList::filter_dtrs_by_owner (StagingProcesses OwnerToFilter,
std::list< DTR_ptr > & FilteredList)**

Filter the queue to select DTRs owned by a specified process.

Parameters:

FilteredList This list is filled with filtered DTRs

**5.105.2.5 bool DataStaging::DTRLList::filter_dtrs_by_status (DTRStatus::DTRStatusType
StatusToFilter, std::list< DTR_ptr > & FilteredList)**

Filter the queue to select DTRs with particular status. If we have only one common queue for all DTRs, this method is necessary to make virtual queues for the DTRs about to go into the pre-, post-processor or delivery stages.

Parameters:

FilteredList This list is filled with filtered DTRs

**5.105.2.6 bool DataStaging::DTRLList::filter_dtrs_by_statuses (const std::vector<
DTRStatus::DTRStatusType > & StatusesToFilter, std::map<
DTRStatus::DTRStatusType, std::list< DTR_ptr > > & FilteredList)**

Filter the queue to select DTRs with particular statuses.

Parameters:

FilteredList This map is filled with filtered DTRs, one list per state.

**5.105.2.7 bool DataStaging::DTRLList::filter_dtrs_by_statuses (const std::vector<
DTRStatus::DTRStatusType > & StatusesToFilter, std::list< DTR_ptr > & FilteredList)**

Filter the queue to select DTRs with particular statuses.

Parameters:

FilteredList This list is filled with filtered DTRs

5.105.2.8 bool DataStaging::DTRLList::filter_pending_dtrs (std::list< DTR_ptr > & *FilteredList*)

Select DTRs that have just arrived from pre-, post-processor, delivery or generator. These DTRs need some reaction from the scheduler. This selection is actually a virtual queue of DTRs that need to be processed.

Parameters:

FilteredList This list is filled with filtered DTRs

The documentation for this class was generated from the following file:

- DTRLList.h

5.106 DataStaging::DTRStatus Class Reference

Class representing the status of a DTR.

```
#include <DTRStatus.h>
```

Public Types

- enum `DTRStatusType` {
 `NEW, CHECK_CACHE, CHECKING_CACHE, CACHE_WAIT,`
`CACHE_CHECKED, RESOLVE, RESOLVING, RESOLVED,`

5.106.1 Detailed Description

Class representing the status of a DTR.

5.106.2 Member Enumeration Documentation

5.106.2.1 enum DataStaging::DTRStatus::DTRStatusType

Possible state values.

Enumerator:

NEW Just created.

CHECK_CACHE Check the cache for the file may be already there.

CHECKING_CACHE Checking the cache.

CACHE_WAIT Cache file is locked, waiting for its release.

CACHE_CHECKED Cache check completed.

RESOLVE Resolve a meta-protocol.

RESOLVING Resolving replicas.

RESOLVED Replica resolution completed.

QUERY_REPLICA Query a replica.

QUERYING_REPLICA Replica is being queried.

REPLICA_QUERIED Replica was queried.

PRE_CLEAN The destination should be deleted.

PRE_CLEANING Deleting the destination.

PRE_CLEANED The destination file has been deleted.

STAGE_PREPARE Prepare or stage the source and/or destination.

STAGING_PREPARING Making a staging or preparing request.

STAGING_PREPARING_WAIT Wait for the status of the staging/preparing request.

STAGED_PREPARED Staging/preparing request completed.

TRANSFER Transfer ready and can be started.

TRANSFERRING Transfer is going.

TRANSFERRING_CANCEL Transfer is on-going but scheduled for cancellation.

TRANSFERRED Transfer completed.

RELEASE_REQUEST Transfer finished, release requests on the storage.

RELEASING_REQUEST Releasing staging/preparing request.

REQUEST_RELEASED Release of staging/preparing request completed.

REGISTER_REPLICA Register a new replica of the destination.

REGISTERING_REPLICA Registering a replica in an index service.

REPLICA_REGISTERED Replica registration completed.

PROCESS_CACHE Destination is cacheable, process cache.

PROCESSING_CACHE Releasing locks and copying/linking cache files to the session dir.

CACHE_PROCESSED Cache processing completed.

DONE Everything completed successfully.

CANCELLED Cancellation request fulfilled successfully.

CANCELLED_FINISHED Cancellation request fulfilled but [DTR](#) also completed transfer successfully.

ERROR Error occurred.

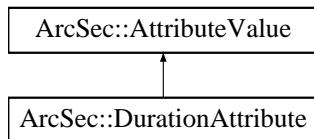

NULL_STATE "Stateless" [DTR](#)

The documentation for this class was generated from the following file:

- DTRStatus.h

5.107 ArcSec::DurationAttribute Class Reference

#include <DateTimeAttribute.h> Inheritance diagram for ArcSec::DurationAttribute::

Public Member Functions

- virtual std::string [encode\(\)](#)
- virtual std::string [getType\(\)](#)
- virtual std::string [getId\(\)](#)

5.107.1 Detailed Description

Format: P??Y??M??DT??H??M??S

5.107.2 Member Function Documentation

5.107.2.1 virtual std::string ArcSec::DurationAttribute::encode() [virtual]

Encode the value in a string format

Implements [ArcSec::AttributeValue](#).

5.107.2.2 virtual std::string ArcSec::DurationAttribute::getId() [inline, virtual]

Get the AttributeId of the <Attribute>

Implements [ArcSec::AttributeValue](#).

5.107.2.3 virtual std::string ArcSec::DurationAttribute::getType() [inline, virtual]

Get the DataType of the <Attribute>

Implements [ArcSec::AttributeValue](#).

The documentation for this class was generated from the following file:

- [DateTimeAttribute.h](#)

5.108 Arc::Endpoint Class Reference

The documentation for this class was generated from the following file:

5.118 ArcSec::EqualFunction Class Reference

Evaluate whether the two values are equal.

```
#include <EqualFunction.h>
```

Public Member Functions

- virtual `AttributeValue * evaluate (AttributeValue *arg0, AttributeValue *arg1, bool check_id=true)`
- virtual `std::list<AttributeValue * > evaluate (std::list<AttributeValue * > args, bool check_id=true)`

Static Public Member Functions

- static `std::string getFunctionName (std::string datatype)`

5.118.1 Detailed Description

Evaluate whether the two values are equal.

5.118.2 Member Function Documentation

5.118.2.1 virtual std::list<AttributeValue*> ArcSec::EqualFunction::evaluate (std::list<AttributeValue * > args, bool check_id = true) [virtual]

Evaluate a list of `AttributeValue` objects, and return a list of Attribute objects

Implements `ArcSec::Function`.

5.118.2.2 virtual AttributeValue* ArcSec::EqualFunction::evaluate (AttributeValue * arg0, AttributeValue * arg1, bool check_id = true) [virtual]

Evaluate two `AttributeValue` objects, and return one `AttributeValue` object

Implements `ArcSec::Function`.

5.118.2.3 static std::string ArcSec::EqualFunction::getFunctionName (std::string datatype) [static]

help function to get the FunctionName

The documentation for this class was generated from the following file:

- EqualFunction.h

5.119 ArcSec::EvalResult Struct Reference

Struct to record the xml node and effect, which will be used by [Evaluator](#) to get the information about which rule/policy(in xmlnode) is satisfied.

```
#include <Result.h>
```

5.119.1 Detailed Description

Struct to record the xml node and effect, which will be used by [Evaluator](#) to get the information about which rule/policy(in xmlnode) is satisfied.

The documentation for this struct was generated from the following file:

- Result.h

5.120 ArcSec::EvaluationCtx Class Reference

[EvaluationCtx](#), in charge of storing some context information for.

```
#include <EvaluationCtx.h>
```

Public Member Functions

- [EvaluationCtx \(Request *request\)](#)

5.120.1 Detailed Description

[EvaluationCtx](#), in charge of storing some context information for.

5.120.2 Constructor & Destructor Documentation

5.120.2.1 ArcSec::EvaluationCtx::EvaluationCtx (Request * *request*) [inline]

Construct a new [EvaluationCtx](#) based on the given request

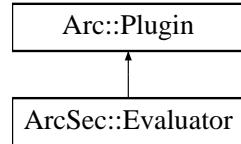

The documentation for this class was generated from the following file:

- EvaluationCtx.h

5.121 ArcSec::Evaluator Class Reference

Interface for policy evaluation. Execute the policy evaluation, based on the request and policy.

```
#include <Evaluator.h>
```

Public Member Functions

- virtual `Response * evaluate (Request *request)=0`
- virtual `Response * evaluate (const Source &request)=0`
- virtual `Response * evaluate (Request *request, const Source &policy)=0`
- virtual `Response * evaluate (const Source &request, const Source &policy)=0`
- virtual `Response * evaluate (Request *request, Policy *policyobj)=0`
- virtual `Response * evaluate (const Source &request, Policy *policyobj)=0`
- virtual `AttributeFactory * getAttrFactory ()=0`
- virtual `FnFactory * getFnFactory ()=0`
- virtual `AlgFactory * getAlgFactory ()=0`
- virtual `void addPolicy (const Source &policy, const std::string &id=\"\")=0`
- virtual `void addPolicy (Policy *policy, const std::string &id=\"\")=0`
- virtual `void setCombiningAlg (EvaluatorCombiningAlg alg)=0`
- virtual `void setCombiningAlg (CombiningAlg *alg=NULL)=0`
- virtual const char * `getName (void) const =0`

Protected Member Functions

- virtual `Response * evaluate (EvaluationCtx *ctx)=0`

5.121.1 Detailed Description

Interface for policy evaluation. Execute the policy evaluation, based on the request and policy.

5.121.2 Member Function Documentation

5.121.2.1 `virtual void ArcSec::Evaluator::addPolicy (Policy * policy, const std::string & id = "") [pure virtual]`

Add policy to the evaluator. `Policy` will be marked with `id`. The policy object is taken over by this instance and will be destroyed in destructor.

5.121.2.2 `virtual void ArcSec::Evaluator::addPolicy (const Source & policy, const std::string & id = "") [pure virtual]`

Add policy from specified source to the evaluator. `Policy` will be marked with `id`.

5.121.2.3 virtual Response* ArcSec::Evaluator::evaluate (EvaluationCtx * *ctx*) [protected, pure virtual]

Evaluate the request by using the [EvaluationCtx](#) object (which includes the information about request). The ctx is destroyed inside this method (why?!?!?).

5.121.2.4 virtual Response* ArcSec::Evaluator::evaluate (const Source & *request*, Policy * *policyobj*) [pure virtual]

Evaluate the request from specified source against the specified policy. In some implementations all of the existing policie inside the evaluator may be destroyed by this method.

5.121.2.5 virtual Response* ArcSec::Evaluator::evaluate (Request * *request*, Policy * *policyobj*) [pure virtual]

Evaluate the specified request against the specified policy. In some implementations all of the existing policy inside the evaluator may be destroyed by this method.

5.121.2.6 virtual Response* ArcSec::Evaluator::evaluate (const Source & *request*, const Source & *policy*) [pure virtual]

Evaluate the request from specified source against the policy from specified source. In some implementations all of the existing policie inside the evaluator may be destroyed by this method.

5.121.2.7 virtual Response* ArcSec::Evaluator::evaluate (Request * *request*, const Source & *policy*) [pure virtual]

Evaluate the specified request against the policy from specified source. In some implementations all of the existing policies inside the evaluator may be destroyed by this method.

5.121.2.8 virtual Response* ArcSec::Evaluator::evaluate (const Source & *request*) [pure virtual]

Evaluates the request by using a specified source

5.121.2.9 virtual Response* ArcSec::Evaluator::evaluate (Request * *request*) [pure virtual]

Evaluates the request by using a [Request](#) object. Evaluation is done till at least one of policies is satisfied.

5.121.2.10 virtual AlgFactory* ArcSec::Evaluator::getAlgFactory () [pure virtual]

Get the [AlgFactory](#) object

Referenced by ArcSec::EvaluatorContext::operator AlgFactory *().

5.121.2.11 virtual AttributeFactory* ArcSec::Evaluator::getAttrFactory () [pure virtual]

Get the [AttributeFactory](#) object

Referenced by ArcSec::EvaluatorContext::operator AttributeFactory *().

5.121.2.12 virtual FnFactory* ArcSec::Evaluator::getFnFactory () [pure virtual]

Get the [FnFactory](#) object

Referenced by ArcSec::EvaluatorContext::operator FnFactory *().

5.121.2.13 virtual const char* ArcSec::Evaluator::getName (void) const [pure virtual]

Get the name of this evaluator

5.121.2.14 virtual void ArcSec::Evaluator::setCombiningAlg (CombiningAlg * *alg* = NULL) [pure virtual]

Specifies loadable combining algorithms. In case of multiple policies their results will be combined using this algorithm. To switch to simple algorithm specify NULL argument.

5.121.2.15 virtual void ArcSec::Evaluator::setCombiningAlg (EvaluatorCombiningAlg *alg*) [pure virtual]

Specifies one of simple combining algorithms. In case of multiple policies their results will be combined using this algorithm.

The documentation for this class was generated from the following file:

- Evaluator.h

5.122 ArcSec::EvaluatorContext Class Reference

Context for evaluator. It includes the factories which will be used to create related objects.

```
#include <Evaluator.h>
```

Public Member Functions

- [operator AttributeFactory * \(\)](#)
- [operator FnFactory * \(\)](#)
- [operator AlgFactory * \(\)](#)

5.122.1 Detailed Description

Context for evaluator. It includes the factories which will be used to create related objects.

5.122.2 Member Function Documentation

5.122.2.1 ArcSec::EvaluatorContext::operator AlgFactory * () [inline]

Returns associated [AlgFactory](#) object

References ArcSec::Evaluator::getAlgFactory().

5.122.2.2 ArcSec::EvaluatorContext::operator AttributeFactory * () [inline]

Returns associated [AttributeFactory](#) object

References ArcSec::Evaluator::getAttrFactory().

5.122.2.3 ArcSec::EvaluatorContext::operator FnFactory * () [inline]

Returns associated [FnFactory](#) object

References ArcSec::Evaluator::getFnFactory().

The documentation for this class was generated from the following file:

- Evaluator.h

5.123 ArcSec::EvaluatorLoader Class Reference

EvaluatorLoader is implemented as a helper class for loading different Evaluator objects, like ArcEvaluator.

```
#include <EvaluatorLoader.h>
```

Public Member Functions

- `Evaluator * getEvaluator (const std::string &classname)`
- `Evaluator * getEvaluator (const Policy *policy)`
- `Evaluator * getEvaluator (const Request *request)`
- `Request * getRequest (const std::string &classname, const Source &requestsource)`
- `Request * getRequest (const Source &requestsource)`
- `Policy * getPolicy (const std::string &classname, const Source &policysource)`
- `Policy * getPolicy (const Source &policysource)`

5.123.1 Detailed Description

EvaluatorLoader is implemented as a helper class for loading different Evaluator objects, like ArcEvaluator. The object loading is based on the configuration information about evaluator, including information for factory class, request, policy and evaluator itself

5.123.2 Member Function Documentation

5.123.2.1 `Evaluator* ArcSec::EvaluatorLoader::getEvaluator (const Request * request)`

Get evaluator object suitable for presented request

5.123.2.2 `Evaluator* ArcSec::EvaluatorLoader::getEvaluator (const Policy * policy)`

Get evaluator object suitable for presented policy

5.123.2.3 `Evaluator* ArcSec::EvaluatorLoader::getEvaluator (const std::string & classname)`

Get evaluator object according to the class name

5.123.2.4 `Policy* ArcSec::EvaluatorLoader::getPolicy (const Source & policysource)`

Get proper policy object according to the policy source

5.123.2.5 `Policy* ArcSec::EvaluatorLoader::getPolicy (const std::string & classname, const Source & policysource)`

Get policy object according to the class name, based on the policy source

5.123.2.6 `Request* ArcSec::EvaluatorLoader::getRequest (const Source & requestsource)`

Get request object according to the request source

5.123.2.7 Request* ArcSec::EvaluatorLoader::getRequest (const std::string & *classname*, const Source & *requestsource*)

Get request object according to the class name, based on the request source

The documentation for this class was generated from the following file:

- EvaluatorLoader.h

5.124 Arc::ExecutableType Class Reference

Executable.

```
#include <JobDescription.h>
```

Data Fields

- std::string [Path](#)
- std::list< std::string > [Argument](#)
- std::pair< bool, int > [SuccessExitCode](#)

5.124.1 Detailed Description

Executable. The [ExecutableType](#) class is used to specify path to an executable, arguments to pass to it when invoked and the exit code for successful execution.

NOTE: The Name string member has been renamed to Path.

5.124.2 Field Documentation

5.124.2.1 std::list<std::string> Arc::ExecutableType::Argument

List of arguments to executable. The Argument list is used to specify arguments which should be passed to the executable upon invocation.

5.124.2.2 std::string Arc::ExecutableType::Path

Path to executable. The Path string should specify the path to an executable. Note that some implementations might only accept a relative path, while others might also accept a absolute one.

5.124.2.3 std::pair<bool, int> Arc::ExecutableType::SuccessExitCode

Exit code at successful execution. The SuccessExitCode pair is used to specify the exit code returned by the executable in case of successful execution. For some scenarios the exit code returned by the executable should be ignored, which is specified by setting the first member of this object to false. If the exit code should be used for validation at the execution service, the first member of pair must be set to true, while the second member should be the exit code returned at successful execution.

The documentation for this class was generated from the following file:

- JobDescription.h

5.125 Arc::ExecutionEnvironmentAttributes Class Reference

Data Fields

- Software OperatingSystem

5.125.1 Field Documentation

5.125.1.1 Software Arc::ExecutionEnvironmentAttributes::OperatingSystem

OperatingSystem. The OperatingSystem member is not present in [GLUE2](#) but contains the three [GLUE2](#) attributes OSFamily, OSName and OSVersion.

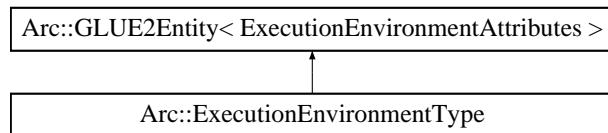

- OSFamily OSFamily_t 1 * The general family to which the Execution Environment operating system belongs.
- OSName OSName_t 0..1 * The specific name of the operating system
- OSVersion String 0..1 * The version of the operating system, as defined by the vendor.

The documentation for this class was generated from the following file:

- ExecutionTarget.h

5.126 Arc::ExecutionEnvironmentType Class Reference

Inheritance diagram for Arc::ExecutionEnvironmentType:::

The documentation for this class was generated from the following file:

- ExecutionTarget.h

5.127 Arc::ExecutionTarget Class Reference

[ExecutionTarget](#).

```
#include <ExecutionTarget.h>
```

Public Member Functions

- [ExecutionTarget \(\)](#)
- [ExecutionTarget \(const ExecutionTarget &t\)](#)
- [ExecutionTarget \(long int addrptr\)](#)
- [void RegisterJobSubmission \(const JobDescription &jobdesc\) const](#)
- [void SaveToStream \(std::ostream &out, bool longlist\) const](#)

5.127.1 Detailed Description

[ExecutionTarget](#). This class describe a target which accept computing jobs. All of the members contained in this class, with a few exceptions, are directly linked to attributes defined in the GLUE Specification v. 2.0 (GFD-R-P.147).

5.127.2 Constructor & Destructor Documentation

5.127.2.1 Arc::ExecutionTarget::ExecutionTarget () [inline]

Create an [ExecutionTarget](#). Default constructor to create an [ExecutionTarget](#). Takes no arguments.

5.127.2.2 Arc::ExecutionTarget::ExecutionTarget (const ExecutionTarget &*t*) [inline]

Create an [ExecutionTarget](#). Copy constructor.

Parameters:

target [ExecutionTarget](#) to copy.

5.127.2.3 Arc::ExecutionTarget::ExecutionTarget (long int *addrptr*) [inline]

Create an [ExecutionTarget](#). Copy constructor? Needed from Python?

Parameters:

addrptr

5.127.3 Member Function Documentation

5.127.3.1 void Arc::ExecutionTarget::RegisterJobSubmission (const JobDescription & *jobdesc*) const

Update [ExecutionTarget](#) after succesful job submission. Method to update the [ExecutionTarget](#) after a job successfully has been submitted to the computing resource it represents. E.g. if a job is sent to the computing resource and is expected to enter the queue, then the WaitingJobs attribute is incremented with 1.

Parameters:

jobdesc contains all information about the job submitted.

5.127.3.2 void Arc::ExecutionTarget::SaveToStream (std::ostream & *out*, bool *longlist*) const

Print the [ExecutionTarget](#) information to a std::ostream object. Method to print the [ExecutionTarget](#) attributes to a std::ostream object.

Parameters:

out is the std::ostream to print the attributes to.

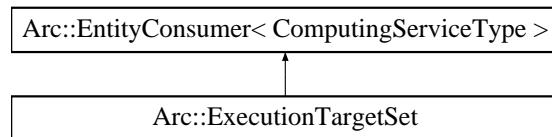

longlist should be set to true for printing a long list.

The documentation for this class was generated from the following file:

- ExecutionTarget.h

5.128 Arc::ExecutionTargetSet Class Reference

Inheritance diagram for Arc::ExecutionTargetSet::

The documentation for this class was generated from the following file:

- `Broker.h`

5.129 Arc::ExpirationReminder Class Reference

A class intended for internal use within counters.

```
#include <Counter.h>
```

Public Member Functions

- bool [operator< \(const ExpirationReminder &other\) const](#)
- Glib::TimeVal [getExpiryTime \(\) const](#)
- Counter::IDType [getReservationID \(\) const](#)

Friends

- class [Counter](#)

5.129.1 Detailed Description

A class intended for internal use within counters. This class is used for "reminder objects" that are used for automatic deallocation of self-expiring reservations.

5.129.2 Member Function Documentation

5.129.2.1 Glib::TimeVal Arc::ExpirationReminder::getExpiryTime () const

Returns the expiry time. This method returns the expiry time of the reservation that this [ExpirationReminder](#) is associated with.

Returns:

The expiry time.

5.129.2.2 Counter::IDType Arc::ExpirationReminder::getReservationID () const

Returns the identification number of the reservation. This method returns the identification number of the self-expiring reservation that this [ExpirationReminder](#) is associated with.

Returns:

The identification number.

5.129.2.3 bool Arc::ExpirationReminder::operator< (const ExpirationReminder & other) const

Less than operator, compares "soonness". This is the less than operator for the [ExpirationReminder](#) class. It compares the priority of such objects with respect to which reservation expires first. It is used when reminder objects are inserted in a priority queue in order to always place the next reservation to expire at the top.

The documentation for this class was generated from the following file:

- Counter.h

5.130 Arc:: FileAccess Class Reference

Defines interface for accessing filesystems.

```
#include <FileAccess.h>
```

- int [geterrno](#) ()
- operator bool (void)
- bool [operator!](#) (void)

Static Public Member Functions

- static void [testtune](#) (void)

5.130.1 Detailed Description

Defines interface for accessing filesystems. This class accesses local filesystem through proxy executable which allows to switch user id in multithreaded systems without introducing conflict with other threads. Its methods are mostly replicas of corresponding POSIX functions with some convenience tweaking.

5.130.2 Member Function Documentation

5.130.2.1 **bool Arc::FileAccess::copy (const std::string & *oldpath*, const std::string & *newpath*, mode_t *mode*)**

Copy file to new location. If new file is created it is assigned specified mode.

5.130.2.2 **int Arc::FileAccess::geterrno () [inline]**

Get errno of last operation. Every operation resets errno.

5.130.2.3 **bool Arc::FileAccess::mkdirp (const std::string & *path*, mode_t *mode*)**

Make a directory and assign it specified mode. If missing all intermediate directories are created too.

5.130.2.4 **bool Arc::FileAccess::mkstemp (std::string & *path*, mode_t *mode*)**

Open new temporary file for writing. On input path contains template of file name ending with XXXXXX. On output path is path to created file.

5.130.2.5 **bool Arc::FileAccess::open (const std::string & *path*, int *flags*, mode_t *mode*)**

Open file. Only one file may be open at a time.

5.130.2.6 **bool Arc::FileAccess::opendir (const std::string & *path*)**

Open directory. Only one directory may be open at a time.

5.130.2.7 **bool Arc::FileAccess::setuid (int *uid*, int *gid*)**

Modify user uid and gid. If any is set to 0 then executable is switched to original uid/gid.

The documentation for this class was generated from the following file:

- FileAccess.h

5.131 Arc::FileLock Class Reference

A general file locking class.

```
#include <FileLock.h>
```

Public Member Functions

- [FileLock](#) (const std::string &filename, unsigned int timeout=[DEFAULT_LOCK_TIMEOUT](#), bool use_pid=true)
- bool [acquire](#) (bool &lock_removed)
- bool [acquire](#) ()
- bool [release](#) (bool force=false)
- int [check](#) (bool log_error=true)

Static Public Member Functions

- static std::string [getLockSuffix](#) ()

Static Public Attributes

- static const int [DEFAULT_LOCK_TIMEOUT](#)
- static const std::string [LOCK_SUFFIX](#)

5.131.1 Detailed Description

A general file locking class. This class can be used when protected access is required to files which are used by multiple processes or threads. Call [acquire\(\)](#) to obtain a lock and [release\(\)](#) to release it when finished. [check\(\)](#) can be used to verify if a lock is valid for the current process. Locks are independent of [FileLock](#) objects - locks are only created and destroyed through [acquire\(\)](#) and [release\(\)](#), not on creation or destruction of [FileLock](#) objects.

Unless use_pid is set false, the process ID and hostname of the calling process are stored in a file filename.lock in the form pid. This information is used to determine whether a lock is still valid. It is also possible to specify a timeout on the lock.

To ensure an atomic locking operation, [acquire\(\)](#) first creates a temporary lock file filename.lock.XXXXXX, then attempts to rename this file to filename.lock. After a successful rename the lock file is checked to make sure the correct process ID and hostname are inside. This eliminates race conditions where multiple processes compete to obtain the lock.

5.131.2 Constructor & Destructor Documentation

5.131.2.1 Arc::FileLock::FileLock (const std::string &filename, unsigned int timeout = [DEFAULT_LOCK_TIMEOUT](#), bool use_pid = true)

Create a new [FileLock](#) object.

Parameters:

filename The name of the file to be locked

timeout The timeout of the lock

use_pid If true, use process id in the lock and to determine lock validity

5.131.3 Member Function Documentation

5.131.3.1 bool Arc::FileLock::acquire ()

Acquire the lock. Callers can use this version of [acquire\(\)](#) if they do not care whether an invalid lock was removed in the process of obtaining the lock.

5.131.3.2 bool Arc::FileLock::acquire (bool & *lock_removed*)

Acquire the lock. Returns true if the lock was acquired successfully. Locks are acquired if no lock file currently exists, or if the current lock file is invalid. A lock is invalid if the process ID inside the lock no longer exists on the host inside the lock, or the age of the lock file is greater than the lock timeout.

Parameters:

lock_removed Set to true if an existing lock was removed due to being invalid. In this case the caller may decide to check or delete the file as it is potentially corrupted.

Returns:

True if lock is successfully acquired

5.131.3.3 int Arc::FileLock::check (bool *log_error* = **true**)

Check the lock is valid. Returns 0 if the lock is valid for the current process, the pid inside the lock if the lock is owned by another process on the same host, and -1 if the lock is owned by another host or any other error occurred. *log_error* may be set to false to log error messages at INFO level, in cases where the lock not existing or being owned by another host are not errors.

5.131.3.4 bool Arc::FileLock::release (bool *force* = **false**)

Release the lock.

Parameters:

force Remove the lock without checking ownership or timeout

The documentation for this class was generated from the following file:

- FileLock.h

5.132 Arc::FinderLoader Class Reference

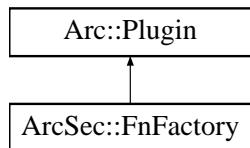

The documentation for this class was generated from the following file:

- FinderLoader.h

5.133 ArcSec::FnFactory Class Reference

Interface for function factory class.

```
#include <FnFactory.h>
```

Public Member Functions

- virtual [Function * createFn](#) (const std::string &*type*)=0

5.133.1 Detailed Description

Interface for function factory class. [FnFactory](#) is in charge of creating [Function](#) object according to the algorithm type given as argument of method `createFn`. This class can be inherited for implementing a factory class which can create some specific [Function](#) objects.

5.133.2 Member Function Documentation

5.133.2.1 virtual [Function* ArcSec::FnFactory::createFn](#) (const std::string & *type*) [pure virtual]

creat algorithm object based on the type algorithm type

Parameters:

type The type of [Function](#)

Returns:

The object of [Function](#)

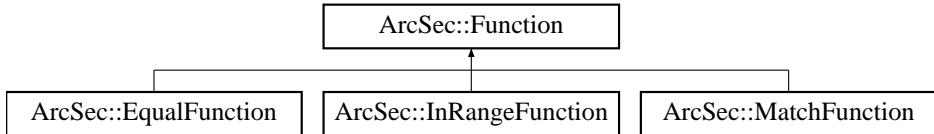

The documentation for this class was generated from the following file:

- FnFactory.h

5.134 ArcSec::Function Class Reference

Interface for function, which is in charge of evaluating two [AttributeValue](#).

```
#include <Function.h>
```

Public Member Functions

- virtual [AttributeValue](#) * [evaluate](#) ([AttributeValue](#) *[arg0](#), [AttributeValue](#) *[arg1](#), bool [check_id=true](#))=0
- virtual std::list<[AttributeValue](#) * > [evaluate](#) (std::list<[AttributeValue](#) * > [args](#), bool [check_id=true](#))=0

5.134.1 Detailed Description

Interface for function, which is in charge of evaluating two [AttributeValue](#).

5.134.2 Member Function Documentation

5.134.2.1 virtual std::list<AttributeValue*> ArcSec::Function::evaluate (std::list<AttributeValue * > args, bool check_id = true) [pure virtual]

Evaluate a list of [AttributeValue](#) objects, and return a list of Attribute objects

Implemented in [ArcSec::EqualFunction](#), [ArcSec::InRangeFunction](#), and [ArcSec::MatchFunction](#).

5.134.2.2 virtual AttributeValue* ArcSec::Function::evaluate (AttributeValue * arg0, AttributeValue * arg1, bool check_id = true) [pure virtual]

Evaluate two [AttributeValue](#) objects, and return one [AttributeValue](#) object

Implemented in [ArcSec::EqualFunction](#), [ArcSec::InRangeFunction](#), and [ArcSec::MatchFunction](#).

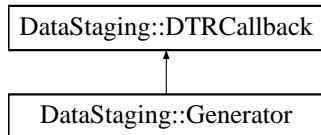

The documentation for this class was generated from the following file:

- Function.h

5.135 DataStaging::Generator Class Reference

Simple [Generator](#) implementation.

```
#include <Generator.h>Inheritance diagram for DataStaging::Generator::
```

Public Member Functions

- virtual void [receiveDTR \(DTR_ptr dtr\)](#)
- void [run \(const std::string &source, const std::string &destination\)](#)

5.135.1 Detailed Description

Simple [Generator](#) implementation. This [Generator](#) implementation is included in the data staging library for basic direct testing of the library and to show how a [Generator](#) can be written. It has one method, [run\(\)](#), which creates a single [DTR](#) and submits it to the [Scheduler](#).

5.135.2 Member Function Documentation

5.135.2.1 virtual void DataStaging::Generator::receiveDTR (DTR_ptr dtr) [virtual]

Implementation of callback from [DTRCallback](#). Callback method used when [DTR](#) processing is complete to pass back to the generator. The [DTR](#) is passed by value so that the scheduler can delete its copy of the object after calling this method.

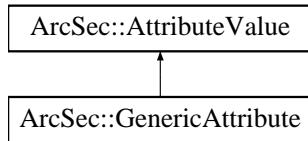

Implements [DataStaging::DTRCallback](#).

The documentation for this class was generated from the following file:

- Generator.h

5.136 ArcSec::GenericAttribute Class Reference

Inheritance diagram for ArcSec::GenericAttribute:::

Public Member Functions

- virtual std::string [encode\(\)](#) [inline, virtual]
- virtual std::string [getType\(\)](#) [inline, virtual]
- virtual std::string [getId\(\)](#) [inline, virtual]

5.136.1 Member Function Documentation

5.136.1.1 virtual std::string ArcSec::GenericAttribute::encode() [inline, virtual]

encode the value in a string format

Implements [ArcSec::AttributeValue](#).

5.136.1.2 virtual std::string ArcSec::GenericAttribute::getId() [inline, virtual]

Get the AttributeId of the <Attribute>

Implements [ArcSec::AttributeValue](#).

5.136.1.3 virtual std::string ArcSec::GenericAttribute::getType() [inline, virtual]

Get the DataType of the <Attribute>

Implements [ArcSec::AttributeValue](#).

The documentation for this class was generated from the following file:

- GenericAttribute.h

5.137 Arc::GlobusResult Class Reference

The documentation for this class was generated from the following file:

- GlobusErrorUtils.h

5.138 Arc::GLUE2 Class Reference

GLUE2 parser.

```
#include <GLUE2.h>
```

Static Public Member Functions

- static void ParseExecutionTargets (XMLNode *glue2tree*, std::list< ComputingServiceType > &*targets*)

5.138.1 Detailed Description

GLUE2 parser. This class parses GLUE2 information rendered in XML and transfers information into various classes representing different types of objects which GLUE2 information model can describe. This parser uses GLUE Specification v. 2.0 (GFD-R-P.147).

5.138.2 Member Function Documentation

5.138.2.1 static void Arc::GLUE2::ParseExecutionTargets (XMLNode *glue2tree*, std::list< ComputingServiceType > &*targets*) [static]

Parses ComputingService elements of GLUE2 into ComputingServiceType objects. The glue2tree is either XML tree representing ComputingService object directly or ComputingService objects are immediate children of it. On exit targets contains ComputingServiceType objects found inside glue2tree. If targets contained any objects on entry those are not destroyed.

Parameters:

glue2tree
targets

The documentation for this class was generated from the following file:

- GLUE2.h

5.139 Arc::GLUE2Entity< T > Class Template Reference

template<typename T> class Arc::GLUE2Entity< T >

The documentation for this class was generated from the following file:

- GLUE2Entity.h

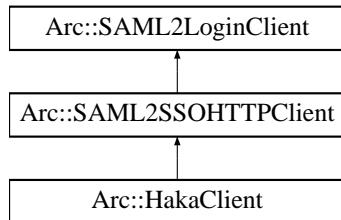

5.140 Arc::GSSCredential Class Reference

The documentation for this class was generated from the following file:

- GSSCredential.h

5.141 Arc::HakaClient Class Reference

Inheritance diagram for Arc::HakaClient:::

Protected Member Functions

- [MCC_Status processIdPLogin \(const std::string username, const std::string password\)](#)
- [MCC_Status processConsent \(\)](#)
- [MCC_Status processIdP2Confusa \(\)](#)

5.141.1 Member Function Documentation

5.141.1.1 MCC_Status Arc::HakaClient::processConsent () [protected, virtual]

If the IdP has a consent module and the user has not saved her consent, this method will ask the user for consent to transmission of her data to Confusa

Implements [Arc::SAML2SSOHTTPClient](#).

5.141.1.2 MCC_Status Arc::HakaClient::processIdP2Confusa () [protected, virtual]

Redirects the user back from identity provider to the Confusa SP

Implements [Arc::SAML2SSOHTTPClient](#).

5.141.1.3 MCC_Status Arc::HakaClient::processIdPLogin (const std::string *username*, const std::string *password*) [protected, virtual]

Actual identity provider parsers for next three methods implemented in subdirectory idp/

Parse identity provider login page and submit username and password in the previsioned way

Implements [Arc::SAML2SSOHTTPClient](#).

The documentation for this class was generated from the following file:

- HakaClient.h

5.142 Arc::FileAccess::header_t Struct Reference

The documentation for this struct was generated from the following file:

- FileAccess.h

5.143 Arc::HTTPClientInfo Struct Reference

Data Fields

- std::string [reason](#)
- uint64_t [size](#)
- [Time lastModified](#)
- std::string [type](#)
- std::list< std::string > [cookies](#)
- std::string [location](#)

The documentation for this struct was generated from the following file:

- ClientInterface.h

5.144 Arc::InfoCache Class Reference

Stores XML document in filesystem split into parts.

```
#include <InfoCache.h>
```

Public Member Functions

- [InfoCache \(const Config &cfg, const std::string &service_id\)](#)

5.144.1 Detailed Description

Stores XML document in filesystem split into parts.

5.144.2 Constructor & Destructor Documentation

5.144.2.1 Arc::InfoCache::InfoCache (const Config & cfg, const std::string & service_id)

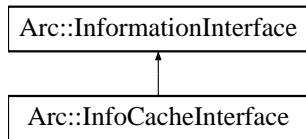

Creates object according to configuration (see InfoCacheConfig.xsd). XML configuration is passed in cfg. Argument service_id is used to distinguish between various documents stored under same path - corresponding files will be stored in subdirectory with service_id name.

The documentation for this class was generated from the following file:

- [InfoCache.h](#)

5.145 Arc::InfoCacheInterface Class Reference

Inheritance diagram for Arc::InfoCacheInterface::

Protected Member Functions

- virtual void [Get](#) (const std::list< std::string > &path, [XMLNodeContainer](#) &result)

5.145.1 Member Function Documentation

5.145.1.1 virtual void Arc::InfoCacheInterface::Get (const std::list< std::string > & path, XMLNodeContainer & result) [protected, virtual]

This method is called by this object's Process method. Real implementation of this class should return (sub)tree of XML document. This method may be called multiple times per single Process call. Here is a set on XML element names specifying how to reach requested node(s).

Reimplemented from [Arc::InformationInterface](#).

The documentation for this class was generated from the following file:

- InfoCache.h

5.146 Arc::InfoFilter Class Reference

Filters information document according to identity of requestor.

```
#include <InfoFilter.h>
```

Public Member Functions

- `InfoFilter (MessageAuth &id)`
- `bool Filter (XMLNode doc) const`
- `bool Filter (XMLNode doc, const InfoFilterPolicies &policies, const NS &ns) const`

5.146.1 Detailed Description

Filters information document according to identity of requestor. Identity is compared to policies stored inside information document and external ones. Parts of document which do not pass policy evaluation are removed.

5.146.2 Constructor & Destructor Documentation

5.146.2.1 Arc::InfoFilter::InfoFilter (MessageAuth & id)

Creates object and associates identity. Associated identity is not copied, hence passed argument must not be destroyed while this method is used.

5.146.3 Member Function Documentation

5.146.3.1 bool Arc::InfoFilter::Filter (XMLNode doc, const InfoFilterPolicies & policies, const NS & ns) const

Filter information document according to internal and external policies. In provided document all policies and nodes which have their policies evaluated to negative result are removed. External policies are provided in policies argument. First element of every pair is XPath defining to which XML node policy must be applied. Second element is policy itself. Argument ns defines XML namespaces for XPath evaluation.

5.146.3.2 bool Arc::InfoFilter::Filter (XMLNode doc) const

Filter information document according to internal policies. In provided document all policies and nodes which have their policies evaluated to negative result are removed.

The documentation for this class was generated from the following file:

- InfoFilter.h

5.147 Arc::InfoRegister Class Reference

Registration to ISIS interface.

```
#include <InfoRegister.h>
```

5.147.1 Detailed Description

Registration to ISIS interface. This class represents service registering to Information Indexing [Service](#). It does not perform registration itself. It only collects configuration information. Configuration is as described in InfoRegisterConfig.xsd for element InfoRegistration.

The documentation for this class was generated from the following file:

- InfoRegister.h

5.148 Arc::InfoRegisterContainer Class Reference

```
#include <InfoRegister.h>
```

Public Member Functions

- `InfoRegistrar * addRegistrar (XMLNode doc)`
- `void addService (InfoRegister *reg, const std::list< std::string > &ids, XMLNode cfg=XMLNode())`
- `void removeService (InfoRegister *reg)`

5.148.1 Detailed Description

Singleton class for scanning configuration and storing references to registration elements.

5.148.2 Member Function Documentation

5.148.2.1 `InfoRegistrar* Arc::InfoRegisterContainer::addRegistrar (XMLNode doc)`

Adds ISISes to list of handled services. Supplied configuration document is scanned for `InfoRegistrar` elements and those are turned into `InfoRegistrar` classes for handling connection to ISIS service each.

5.148.2.2 `void Arc::InfoRegisterContainer::addService (InfoRegister * reg, const std::list< std::string > & ids, XMLNode cfg = XMLNode ())`

Adds service to list of handled. This method must be called first time after last `addRegistrar` was called - services will be only associated with ISISes which are already added. Argument `ids` contains list of ISIS identifiers to which service is associated. If `ids` is empty then service is associated to all ISISes currently added. If argument `cfg` is available and no ISISes are configured then `addRegistrar`s is called with `cfg` used as configuration document.

5.148.2.3 `void Arc::InfoRegisterContainer::removeService (InfoRegister * reg)`

This method must be called if service being destroyed.

The documentation for this class was generated from the following file:

- `InfoRegister.h`

5.149 Arc::InfoRegisters Class Reference

Handling multiple registrations to ISISes.

```
#include <InfoRegister.h>
```

Public Member Functions

- `InfoRegisters (XMLNode cfg, Service *service)`
- `bool addRegister (XMLNode cfg, Service *service)`

5.149.1 Detailed Description

Handling multiple registrations to ISISes.

5.149.2 Constructor & Destructor Documentation

5.149.2.1 Arc::InfoRegisters::InfoRegisters (XMLNode *cfg*, Service * *service*)

Constructor creates `InfoRegister` objects according to configuration. Inside `cfg` elements `InfoRegister` are found and for each corresponding `InfoRegister` object is created. Those objects are destroyed in destructor of this class.

The documentation for this class was generated from the following file:

- `InfoRegister.h`

5.150 Arc::InfoRegistrar Class Reference

Registration process associated with particular ISIS.

```
#include <InfoRegister.h>
```

Public Member Functions

- void [registration](#) (void)
- bool [addService](#) ([InfoRegister](#) *, [XMLNode](#))
- bool [removeService](#) ([InfoRegister](#) *)

5.150.1 Detailed Description

Registration process associated with particular ISIS. Instance of this class starts thread which takes care passing information about associated services to ISIS service defined in configuration. Configuration is as described in [InfoRegister.xsd](#) for element [InfoRegistrar](#).

5.150.2 Member Function Documentation

5.150.2.1 bool Arc::InfoRegistrar::addService ([InfoRegister](#) *, [XMLNode](#))

Adds new service to list of handled services. [Service](#) is described by it's [InfoRegister](#) object which must be valid as long as this object is functional.

5.150.2.2 void Arc::InfoRegistrar::registration (void)

Performs registartion in a loop. Never exits unless there is a critical error or requested by destructor.

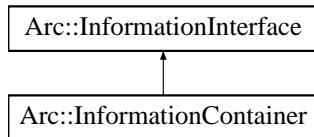

The documentation for this class was generated from the following file:

- [InfoRegister.h](#)

5.151 Arc::InformationContainer Class Reference

Information System document container and processor.

```
#include <InformationInterface.h>
```

Public Member Functions

- [InformationContainer \(XMLNode doc, bool copy=false\)](#)
- [XMLNode Acquire \(void\)](#)
- void [Assign \(XMLNode doc, bool copy=false\)](#)

Protected Member Functions

- virtual void [Get \(const std::list< std::string > &path, XMLNodeContainer &result\)](#)

Protected Attributes

- [XMLNode doc_](#)

5.151.1 Detailed Description

Information System document container and processor. This class inherits form [InformationInterface](#) and offers container for storing informational XML document.

5.151.2 Constructor & Destructor Documentation

5.151.2.1 Arc::InformationContainer::InformationContainer (XMLNode *doc*, bool *copy = false*)

Creates an instance with XML document . If is true this method makes a copy of for internal use.

5.151.3 Member Function Documentation

5.151.3.1 XMLNode Arc::InformationContainer::Acquire (void)

Get a lock on contained XML document. To be used in multi-threaded environment. Do not forget to release it with [Release\(\)](#)

5.151.3.2 void Arc::InformationContainer::Assign (XMLNode *doc*, bool *copy = false*)

Replaces internal XML document with . If is true this method makes a copy of for internal use.

**5.151.3.3 virtual void Arc::InformationContainer::Get (const std::list< std::string > & path,
XMLNodeContainer & result) [protected, virtual]**

This method is called by this object's Process method. Real implementation of this class should return (sub)tree of XML document. This method may be called multiple times per single Process call. Here is a set on XML element names specifying how to reach requested node(s).

Reimplemented from [Arc::InformationInterface](#).

5.151.4 Field Documentation

5.151.4.1 XMLNode Arc::InformationContainer::doc_ [protected]

Either link or container of XML document

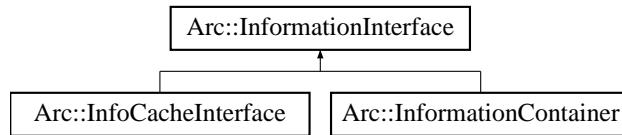

The documentation for this class was generated from the following file:

- [InformationInterface.h](#)

5.152 Arc::InformationInterface Class Reference

Information System message processor.

```
#include <InformationInterface.h>
```

Public Member Functions

- [InformationInterface \(bool safe=true\)](#)

Protected Member Functions

- virtual void [Get](#) (const std::list< std::string > &path, [XMLNodeContainer](#) &result)

Protected Attributes

- [Glib::Mutex lock_](#)

5.152.1 Detailed Description

Information System message processor. This class provides callback for 2 operations of WS-ResourceProperties and convenient parsing/generation of corresponding SOAP messages. In a future it may extend range of supported specifications.

5.152.2 Constructor & Destructor Documentation

5.152.2.1 Arc::InformationInterface::InformationInterface (bool safe = true)

Constructor. If 'safe' is true all calls to Get will be locked.

5.152.3 Member Function Documentation

5.152.3.1 virtual void Arc::InformationInterface::Get (const std::list< std::string > & path, XMLNodeContainer & result) [protected, virtual]

This method is called by this object's Process method. Real implementation of this class should return (sub)tree of XML document. This method may be called multiple times per single Process call. Here is a set on XML element names specifying how to reach requested node(s).

Reimplemented in [Arc::InfoCacheInterface](#), and [Arc::InformationContainer](#).

5.152.4 Field Documentation

5.152.4.1 Glib::Mutex Arc::InformationInterface::lock_ [protected]

Mutex used to protect access to Get methods in multi-threaded env.

The documentation for this class was generated from the following file:

- InformationInterface.h

5.153 Arc::InformationRequest Class Reference

Request for information in InfoSystem.

```
#include <InformationInterface.h>
```

Public Member Functions

- [InformationRequest \(void\)](#)
- [InformationRequest \(const std::list< std::string > &path\)](#)
- [InformationRequest \(const std::list< std::list< std::string > > &paths\)](#)
- [InformationRequest \(XMLNode query\)](#)
- [SOAPEnvelope * SOAP \(void\)](#)

5.153.1 Detailed Description

Request for information in InfoSystem. This is a convenience wrapper creating proper WS-ResourceProperties request targeted InfoSystem interface of service.

5.153.2 Constructor & Destructor Documentation

5.153.2.1 Arc::InformationRequest::InformationRequest (void)

Dummy constructor

5.153.2.2 Arc::InformationRequest::InformationRequest (const std::list< std::string > & path)

Request for attribute specified by elements of path. Currently only first element is used.

5.153.2.3 Arc::InformationRequest::InformationRequest (const std::list< std::list< std::string > > & paths)

Request for attribute specified by elements of paths. Currently only first element of every path is used.

5.153.2.4 Arc::InformationRequest::InformationRequest (XMLNode query)

Request for attributes specified by XPath query.

5.153.3 Member Function Documentation

5.153.3.1 SOAPEnvelope* Arc::InformationRequest::SOAP (void)

Returns generated SOAP message

The documentation for this class was generated from the following file:

- InformationInterface.h

5.154 Arc::InformationResponse Class Reference

Informational response from InfoSystem.

```
#include <InformationInterface.h>
```

Public Member Functions

- [InformationResponse \(SOAPEnvelope &soap\)](#)
- std::list<[XMLNode](#)> [Result \(void\)](#)

5.154.1 Detailed Description

Informational response from InfoSystem. This is a convenience wrapper analyzing WS-ResourceProperties response from InfoSystem interface of service.

5.154.2 Constructor & Destructor Documentation

5.154.2.1 Arc::InformationResponse::InformationResponse (SOAPEnvelope & soap)

Constructor parses WS-ResourceProperties response. Provided SOAPEnvelope object must be valid as long as this object is in use.

5.154.3 Member Function Documentation

5.154.3.1 std::list<[XMLNode](#)> Arc::InformationResponse::Result (void)

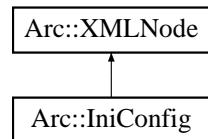

Returns set of attributes which were in SOAP message passed to constructor.

The documentation for this class was generated from the following file:

- [InformationInterface.h](#)

5.155 Arc::IniConfig Class Reference

Inheritance diagram for Arc::IniConfig::

The documentation for this class was generated from the following file:

- IniConfig.h

5.156 Arc::initializeCredentialsType Class Reference

Defines how user credentials are looked for.

```
#include <UserConfig.h>
```

5.156.1 Detailed Description

Defines how user credentials are looked for. For complete information see description of UserConfig::InitializeCredentials(initializeCredentials) method.

The documentation for this class was generated from the following file:

- UserConfig.h

5.157 Arc::InputFileType Class Reference

Data Fields

- std::string [Checksum](#)

5.157.1 Field Documentation

5.157.1.1 std::string Arc::InputFileType::Checksum

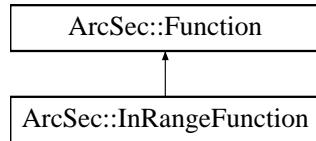

CRC32 checksum of file. The Checksum attribute specifies the textual representation of CRC32 checksum of file in base 10.

The documentation for this class was generated from the following file:

- JobDescription.h

5.158 ArcSec::InRangeFunction Class Reference

Inheritance diagram for ArcSec::InRangeFunction::

Public Member Functions

- virtual `AttributeValue * evaluate (AttributeValue *arg0, AttributeValue *arg1, bool check_id=true)`
- virtual `std::list<AttributeValue * > evaluate (std::list<AttributeValue * > args, bool check_id=true)`

5.158.1 Member Function Documentation

5.158.1.1 virtual std::list<AttributeValue*> ArcSec::InRangeFunction::evaluate (std::list<AttributeValue * > args, bool check_id = true) [virtual]

Evaluate a list of `AttributeValue` objects, and return a list of Attribute objects

Implements `ArcSec::Function`.

5.158.1.2 virtual AttributeValue* ArcSec::InRangeFunction::evaluate (AttributeValue * arg0, AttributeValue * arg1, bool check_id = true) [virtual]

Evaluate two `AttributeValue` objects, and return one `AttributeValue` object

Implements `ArcSec::Function`.

The documentation for this class was generated from the following file:

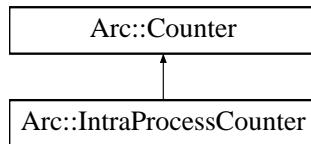

- `InRangeFunction.h`

5.159 Arc::IntraProcessCounter Class Reference

A class for counters used by threads within a single process.

```
#include <IntraProcessCounter.h>
```

Inheritance diagram for Arc::IntraProcessCounter::

Public Member Functions

- [IntraProcessCounter \(int limit, int excess\)](#)
- virtual [~IntraProcessCounter \(\)](#)
- virtual int [getLimit \(\)](#)
- virtual int [setLimit \(int newLimit\)](#)

- virtual int [getExcess \(\)](#)
- virtual int [setExcess \(int newExcess\)](#)
- virtual int [changeExcess \(int amount\)](#)
- virtual int [getValue \(\)](#)
- virtual [CounterTicket reserve \(int amount=1, Glib::TimeVal duration=ETERNAL, bool prioritized=false, Glib::TimeVal timeOut=ETERNAL\)](#)

Protected Member Functions

- virtual void [cancel \(IDType reservationID\)](#)
- virtual void [extend \(IDType &reservationID, Glib::TimeVal &expiryTime, Glib::TimeVal duration=ETERNAL\)](#)

5.159.1 Detailed Description

A class for counters used by threads within a single process. This is a class for shared among different threads within a single process. See the [Counter](#) class for further information about counters and examples of usage.

5.159.2 Constructor & Destructor Documentation

5.159.2.1 Arc::IntraProcessCounter::IntraProcessCounter (int *limit*, int *excess*)

Creates an [IntraProcessCounter](#) with specified limit and excess. This constructor creates a counter with the specified limit (amount of resources available for reservation) and excess limit (an extra amount of resources that may be used for prioritized reservations).

Parameters:

- limit* The limit of the counter.
- excess* The excess limit of the counter.

5.159.2.2 virtual Arc::IntraProcessCounter::~IntraProcessCounter () [virtual]

Destructor. This is the destructor of the [IntraProcessCounter](#) class. Does not need to do anything.

5.159.3 Member Function Documentation

5.159.3.1 virtual void Arc::IntraProcessCounter::cancel (IDType *reservationID*) [protected, virtual]

Cancellation of a reservation. This method cancels a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

Parameters:

reservationID The identity number (key) of the reservation to cancel.

Implements [Arc::Counter](#).

5.159.3.2 virtual int Arc::IntraProcessCounter::changeExcess (int *amount*) [virtual]

Changes the excess limit of the counter. Changes the excess limit of the counter by adding a certain amount to the current excess limit.

Parameters:

amount The amount by which to change the excess limit.

Returns:

The new excess limit.

Implements [Arc::Counter](#).

5.159.3.3 virtual int Arc::IntraProcessCounter::changeLimit (int *amount*) [virtual]

Changes the limit of the counter. Changes the limit of the counter by adding a certain amount to the current limit.

Parameters:

amount The amount by which to change the limit.

Returns:

The new limit.

Implements [Arc::Counter](#).

5.159.3.4 virtual void Arc::IntraProcessCounter::extend (IDType & *reservationID*, Glib::TimeVal & *expiryTime*, Glib::TimeVal *duration* = ETERNAL) [protected, virtual]

Extension of a reservation. This method extends a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

Parameters:

reservationID Used for input as well as output. Contains the identification number of the original reservation on entry and the new identification number of the extended reservation on exit.

expiryTime Used for input as well as output. Contains the expiry time of the original reservation on entry and the new expiry time of the extended reservation on exit.

duration The time by which to extend the reservation. The new expiration time is computed based on the current time, NOT the previous expiration time.

Implements [Arc::Counter](#).

5.159.3.5 virtual int Arc::IntraProcessCounter::getExcess () [virtual]

Returns the excess limit of the counter. Returns the excess limit of the counter, i.e. by how much the usual limit may be exceeded by prioritized reservations.

Returns:

The excess limit.

Implements [Arc::Counter](#).

5.159.3.6 virtual int Arc::IntraProcessCounter::getLimit () [virtual]

Returns the current limit of the counter. This method returns the current limit of the counter, i.e. how many units can be reserved simultaneously by different threads without claiming high priority.

Returns:

The current limit of the counter.

Implements [Arc::Counter](#).

5.159.3.7 virtual int Arc::IntraProcessCounter::getValue () [virtual]

Returns the current value of the counter. Returns the current value of the counter, i.e. the number of unreserved units. Initially, the value is equal to the limit of the counter. When a reservation is made, the value is decreased. Normally, the value should never be negative, but this may happen if there are prioritized reservations. It can also happen if the limit is decreased after some reservations have been made, since reservations are never revoked.

Returns:

The current value of the counter.

Implements [Arc::Counter](#).

5.159.3.8 virtual CounterTicket Arc::IntraProcessCounter::reserve (int *amount* = 1, Glib::TimeVal *duration* = ETERNAL, bool *prioritized* = false, Glib::TimeVal *timeOut* = ETERNAL) [virtual]

Makes a reservation from the counter. This method makes a reservation from the counter. If the current value of the counter is too low to allow for the reservation, the method blocks until the reservation is possible or times out.

Parameters:

- amount*** The amount to reserve, default value is 1.
- duration*** The duration of a self expiring reservation, default is that it lasts forever.
- prioritized*** Whether this reservation is prioritized and thus allowed to use the excess limit.
- timeOut*** The maximum time to block if the value of the counter is too low, default is to allow "eternal" blocking.

Returns:

A [CounterTicket](#) that can be queried about the status of the reservation as well as for cancellations and extensions.

Implements [Arc::Counter](#).

5.159.3.9 virtual int Arc::IntraProcessCounter::setExcess (int *newExcess*) [virtual]

Sets the excess limit of the counter. This method sets a new excess limit for the counter.

Parameters:

- newExcess*** The new excess limit, an absolute number.

Returns:

The new excess limit.

Implements [Arc::Counter](#).

5.159.3.10 virtual int Arc::IntraProcessCounter::setLimit (int *newLimit*) [virtual]

Sets the limit of the counter. This method sets a new limit for the counter.

Parameters:

- newLimit*** The new limit, an absolute number.

Returns:

The new limit.

Implements [Arc::Counter](#).

5.163.1 Detailed Description

[Job](#). This class describe a Grid job. Most of the members contained in this class are directly linked to the ComputingActivity defined in the GLUE Specification v. 2.0 (GFD-R-P.147).

5.163.2 Constructor & Destructor Documentation

5.163.2.1 Arc::Job::Job ()

Create a [Job](#) object. Default constructor. Takes no arguments.

5.163.3 Member Function Documentation

5.163.3.1 Job& Arc::Job::operator= (XMLNode job)

Set `Job` attributes from a `XMLNode`. The attributes of the `Job` object is set to the values specified in the `XMLNode`. The `XMLNode` should be a `ComputingActivity` type using the `GLUE2` XML hierarchical rendering, see <http://forge.gridforum.org/sf/wiki/do/viewPage/projects.glue-wg/wiki/GLUE2XMLSchema> for more information. Note that associations are not parsed.

Parameters:

`job` is a `XMLNode` of `GLUE2 ComputingActivity` type.

See also:

[ToXML](#)

5.163.3.2 static bool Arc::Job::ReadAllJobsFromFile (const std::string &*filename*, std::list< Job > &*jobs*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Read all jobs from file. This static method will read jobs (in XML format) from the specified file, and they will be stored in the referenced list of jobs. The XML element in the file representing a job should be named "Job", and have the same format as accepted by the `operator=(XMLNode)` method.

File locking: To avoid simultaneous use (writing and reading) of the file, reading will not be initiated before a lock on the file has been acquired. For this purpose the `FileLock` class is used. `nTries` specifies the maximal number of times the method will try to acquire a lock on the file, with an interval of `tryInterval` micro seconds between each attempt. If a lock is not acquired* this method returns false.

The method will also return false if the content of file is not in XML format. Otherwise it returns true.

Parameters:

`filename` is the filename of the job list to read jobs from.

`jobs` is a reference to a list of `Job` objects, which will be filled with the jobs read from file (cleared before use).

`nTries` specifies the maximal number of times the method will try to acquire a lock on file to read.

`tryInterval` specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

See also:

[operator=\(XMLNode\)](#)
[ReadJobsFromFile](#)
[WriteJobsToTruncatedFile](#)
[WriteJobsToFile](#)
[RemoveJobsFromFile](#)
[FileLock](#)
[XMLNode::ReadFromFile](#)

5.163.3.3 static bool Arc::Job::ReadJobIDsFromFile (const std::string & *filename*, std::list< std::string > & *jobids*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Read a list of [Job](#) IDs from a file, and append them to a list. This static method will read job IDs from the given file, and append the strings to the string list given as parameter. File locking will be done as described for the [ReadAllJobsFromFile](#) method. It returns false if the file was not readable, true otherwise, even if there were no IDs in the file. The lines of the file will be trimmed, and lines starting with # will be ignored.

Parameters:

filename is the filename of the jobidfile

jobids is a list of strings, to which the IDs read from the file will be appended

nTries specifies the maximal number of times the method will try to acquire a lock on file to read.

tryInterval specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

5.163.3.4 static bool Arc::Job::ReadJobsFromFile (const std::string & *filename*, std::list< Job > & *jobs*, std::list< std::string > & *jobIdentifiers*, bool *all* = false, const std::list< std::string > & *endpoints* = std::list< std::string >(), const std::list< std::string > & *rejectEndpoints* = std::list< std::string >(), unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Read specified jobs from file. Extract job information for jobs specified by job identifiers and/or endpoints from job list file. The method read all jobs from specified job list file, using the [ReadAllJobsFromFile](#) method. If the all argument is false, jobs will only be put into the list of [Job](#) objects (jobs) if the ID-FromEndpoint or Name attributes of the [Job](#) object matches one of the entries in the jobIdentifiers list argument or if the Cluster attribute of the [Job](#) object matches one of the entries in the endpoints list argument (if specified), using the [URL::StringMatches](#) method. If the all argument is true, none of those matchings is carried out, instead all jobs are put into the list of [Job](#) objects. For both values of the all argument, the entries in the jobIdentifiers list will be removed if corresponding to a job in the jobs list. In the end, if the rejectEndpoints list is non-empty, the jobs list will be filtered by removing [Job](#) objects for which the Cluster attribute matches those in the rejectEndpoints list, using the [URL::StringMatches](#) method. This method returns true, except when the [ReadAllJobsFromFile](#) method returns false.

Parameters:

filename is the filename of the job list to read jobs from.

jobs is a reference to a list of [Job](#) objects, which will be filled with the jobs read from file (cleared before use).

jobIdentifiers specifies the job IDs and names of jobs to be put into the jobs list. Entries in this list is removed if found among the jobs in the job list file.

all specifies whether all jobs from the jobs list should be put into the jobs list.

endpoints is a list of strings resembling endpoints for which [Job](#) objects having matching Cluster attribute should be added to the jobs list.

rejectEndpoints is a list of strings resembling endpoint for which [Job](#) objects having matching Cluster attribute should be removed from the jobs list. Overrides jobIdentifiers, all and endpoints.

nTries will be passed to the [ReadAllJobsFromFile](#) method

tryInterval will be passed to the ReadAllJobsFromFile method

Returns:

true in case of success, otherwise false.

See also:

[ReadAllJobsFromFile](#)
[URL::StringMatches](#)
[WriteJobsToTruncatedFile](#)
[WriteJobsToFile](#)
[RemoveJobsFromFile](#)

5.163.3.5 static bool Arc::Job::RemoveJobsFromFile (const std::string & *filename*, const std::list< URL > & *jobids*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Remove job from file. This static method will remove the jobs having IDFromEndpoint identical to any of those in the passed list *jobids*. File locking will be done as described for the ReadAllJobsFromFile method. The method will return false if reading from or writing jobs to the file fails. Otherwise it returns true.

Parameters:

filename is the filename of the job list to write jobs to.

jobids is a list of [URL](#) objects which specifies which jobs from the file to remove.

nTries specifies the maximal number of times the method will try to acquire a lock on file to read.

tryInterval specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

See also:

[ReadAllJobsFromFile](#)
[WriteJobsToTruncatedFile](#)
[WriteJobsToFile](#)
[FileLock](#)
[XMLNode::ReadFromFile](#)
[XMLNode::SaveToFile](#)

5.163.3.6 void Arc::Job::SaveToStream (std::ostream & *out*, bool *longlist*) const

Write job information to a std::ostream object. This method will write job information to the passed std::ostream object. The longlist boolean specifies whether more (true) or less (false) information should be printed.

Parameters:

out is the std::ostream object to print the attributes to.

longlist is a boolean for switching on long listing (more details).

5.163.3.7 void Arc::Job::ToXML (XMLNode *job*) const

Add job information to a [XMLNode](#). Child nodes of GLUE ComputingActivity type containing job information of this object will be added to the passed [XMLNode](#).

Parameters:

job is the [XMLNode](#) to add job information to in form of [GLUE2](#) ComputingActivity type child nodes.

See also:

operator=

5.163.3.8 void Arc::Job::Update (XMLNode *job*)

Set [Job](#) attributes from a [XMLNode](#) representing [GLUE2](#) ComputingActivity. Because job XML representation follows [GLUE2](#) model this method is similar to [operator=\(XMLNode\)](#). But it only covers job attributes which are part of [GLUE2](#) computing activity. Also it treats [Job](#) object as being iextended with information provided by [XMLNode](#). Contrary [operator=\(XMLNode\)](#) fully reinitializes [Job](#), hence removing any associations to other objects.

5.163.3.9 static bool Arc::Job::WriteJobIDsToFile (const std::list< URL > & *jobids*, const std::string & *filename*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Append list of URLs to a file. This static method will put the ID given as a string, and append it to the given file. File locking will be done as described for the ReadAllJobsFromFile method. It returns false if the file was not writable, true otherwise.

Parameters:

jobid is a list of [URL](#) objects to be written to file

filename is the filename of file, where the [URL](#) objects will be appended to.

nTries specifies the maximal number of times the method will try to acquire a lock on file to read.

tryInterval specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

5.163.3.10 static bool Arc::Job::WriteJobIDToFile (const URL & *jobid*, const std::string & *filename*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Append a jobID to a file. This static method will put the ID represented by a [URL](#) object, and append it to the given file. File locking will be done as described for the ReadAllJobsFromFile method. It returns false if the file is not writable, true otherwise.

Parameters:

jobid is a jobID as a [URL](#) object

filename is the filename of the jobidfile, where the jobID will be appended
nTries specifies the maximal number of times the method will try to acquire a lock on file to read.
tryInterval specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

5.163.3.11 static bool Arc::Job::WriteJobsToFile (const std::string & *filename*, const std::list<Job > & *jobs*, std::list< const Job * > & *newJobs*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Write jobs to file. This static method will write (append) the passed list of jobs to the specified file. Jobs will be written in XML format as returned by the ToXML method, and each job will be contained in a element named "Job". If the passed list of jobs contains two identical jobs (i.e. IDFromEndpoint identical), only the latter Job object is stored. If a job in the list is identical to one in file, the one in file will be replaced with the one from the list. A pointer (no memory allocation) to those jobs from the list which are not in the file will be added to the newJobs list, thus these pointers goes out of scope when 'jobs' list goes out of scope. File locking will be done as described for the ReadAllJobsFromFile method. The method will return false if writing jobs to the file fails. Otherwise it returns true.

Parameters:

filename is the filename of the job list to write jobs to.
jobs is the list of Job objects which should be written to file.
newJobs is a reference to a list of pointers to Job objects which are not duplicates.
nTries specifies the maximal number of times the method will try to acquire a lock on file to read.
tryInterval specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

See also:

[ToXML](#)
[ReadAllJobsFromFile](#)
[WriteJobsToTruncatedFile](#)
[RemoveJobsFromFile](#)
[FileLock](#)
[XMLNode::SaveToFile](#)

5.163.3.12 static bool Arc::Job::WriteJobsToFile (const std::string & *filename*, const std::list<Job > & *jobs*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000) [static]

Write jobs to file. This method is in all respects identical to the [WriteJobsToFile\(const std::string&, const std::list<Job>&, std::list<const Job*>&, unsigned, unsigned\)](#) method, except for the information about new jobs which is disregarded.

See also:

[WriteJobsToFile\(const std::string&, const std::list<Job>&, std::list<const Job*>&, unsigned, unsigned\)](#)

5.163.3.13 static bool Arc::Job::WriteJobsToTruncatedFile (const std::string & *filename*, const std::list< Job > & *jobs*, unsigned *nTries* = 10, unsigned *tryInterval* = 500000)
[static]

Truncate file and write jobs to it. This static method will write the passed list of jobs to the specified file, but before writing the file will be truncated. Jobs will be written in XML format as returned by the ToXML method, and each job will be contained in a element named "Job". If the passed list of jobs contains two identical jobs (i.e. IDFFromEndpoint identical), only the latter Job object is stored. File locking will be done as described for the ReadAllJobsFromFile method. The method will return false if writing jobs to the file fails. Otherwise it returns true.

Parameters:

filename is the filename of the job list to write jobs to.

jobs is the list of Job objects which should be written to file.

nTries specifies the maximal number of times the method will try to acquire a lock on file to read.

tryInterval specifies the interval (in micro seconds) between each attempt to acquire a lock.

Returns:

true in case of success, otherwise false.

5.168.1 Detailed Description

The `JobDescription` class is the internal representation of a job description in the ARC-lib. It is structured into a number of other classes/objects which should strictly follow the description given in the job description document [<http://svn.nordugrid.org/trac/nordugrid/browser/arc1/trunk/doc/tech-doc/client/job_description.odt>](http://svn.nordugrid.org/trac/nordugrid/browser/arc1/trunk/doc/tech-doc/client/job_description.odt).

The class consist of a parsing method `JobDescription::Parse` which tries to parse the passed source using a number of different parsers. The parser method is complemented by the `JobDescription::UnParse` method, a method to generate a job description document in one of the supported formats. Additionally the internal representation is contained in public members which makes it directly accessible and modifiable from outside the scope of the class.

5.168.2 Member Function Documentation

5.168.2.1 `const std::string& Arc::JobDescription::GetSourceLanguage () const [inline]`

Get input source language. If this object was created by a `JobDescriptionParser`, then this method returns a string which indicates the job description language of the parsed source. If not created by a `JobDescriptionParser` the string returned is empty.

Returns:

`const std::string& source langauge of parsed input source.`

5.168.2.2 static JobDescriptionResult Arc::JobDescription::Parse (const std::string & *source*, std::list< JobDescription > & *jobdescs*, const std::string & *language* = "", const std::string & *dialect* = "") [static]

Parse string into [JobDescription](#) objects. The passed string will be tried parsed into the list of [JobDescription](#) objects. The available specialized [JobDescriptionParser](#) classes will be tried one by one, parsing the string, and if one succeeds the list of [JobDescription](#) objects is filled with the parsed contents and true is returned, otherwise false is returned. If no language specified, each [JobDescriptionParser](#) will try all its supported languages. On the other hand if a language is specified, only the [JobDescriptionParser](#) supporting that language will be tried. A dialect can also be specified, which only has an effect on the parsing if the [JobDescriptionParser](#) supports that dialect.

Parameters:

- source*
- jobdescs*
- language*
- dialect*

Returns:

true if the passed string can be parsed successfully by any of the available parsers.

5.168.2.3 bool Arc::JobDescription::Prepare (const ExecutionTarget & *et*)

Prepare for submission to target. The Prepare method, is used to check and adapt the [JobDescription](#) object to the passed [ExecutionTarget](#) object before submitting the job description to the target. This method is normally called by [SubmitterPlugin](#) plugin classes, before submitting the job description. First the method checks the DataStaging.InputFiles list, for identical file names, and non-existent local input files. If any of such files are found, the method returns false. Then if the Application.Executable and Application.Input objects are specified as local input files, and they are not among the files in the DataStaging.InputFiles list a existence check will be done and if not found, false will be returned, otherwise they will be added to the list. Likewise if the Application.Output, Application.Error and Application.LogDir attributes have been specified, and is not among the files in the DataStaging.OutputFiles list, they will be added to this list. After the file check, the Resources.RunTimeEnvironment, Resources.CEType and Resources.OperatingSystem [SoftwareRequirement](#) objects are respectively resolved against the ExecutionTarget::ApplicationEnvironments, ExecutionTarget::Implementation and ExecutionTarget::OperatingSystem [Software](#) objects using the [SoftwareRequirement::selectSoftware](#) method. If that method returns false i.e. unable to resolve the requirements false will be returned. After resolving software requirements, the value of the Resources.QueueName attribute will be set to that of the ExecutionTarget::ComputingShareName attribute, and then true is returned.

Parameters:

et [ExecutionTarget](#) object which to resolve software requirements against, and to pick up queue name from.

Returns:

false is returned if file checks fails, or if unable to resolve software requirements.

5.168.2.4 JobDescriptionResult Arc::JobDescription::SaveToStream (std::ostream & *out*, const std::string & *format*) const

Print job description to a std::ostream object. The job description will be written to the passed std::ostream object out in the format indicated by the format parameter. The format parameter should specify the format of one of the job description languages supported by the library. Or by specifying the special "user" or "userlong" format the job description will be written as a attribute/value pair list with respectively less or more attributes.

The mote

Returns:

true if writing the job description to the out object succeeds, otherwise false.

Parameters:

out a std::ostream reference specifying the ostream to write the job description to.

format specifies the format the job description should written in.

5.168.2.5 JobDescriptionResult Arc::JobDescription::UnParse (std::string & *product*, std::string *language*, const std::string & *dialect* = "") const

Output contents in the specified language.

Parameters:

product

language

dialect

Returns:

5.168.3 Field Documentation

5.168.3.1 std::map<std::string, std::string> Arc::JobDescription::OtherAttributes

Holds attributes not fitting into this class. This member is used by [JobDescriptionParser](#) classes to store attribute/value pairs not fitting into attributes stored in this class. The form of the attribute (the key in the map) should be as follows: <language>;<attribute-name> E.g.: "nordugrid:xrsl;hostname".

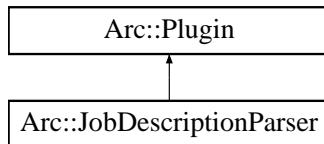

The documentation for this class was generated from the following file:

- JobDescription.h

5.169 Arc::JobDescriptionParser Class Reference

Abstract class for the different parsers.

```
#include <JobDescriptionParser.h>Inheritance diagram for Arc::JobDescriptionParser::
```

5.169.1 Detailed Description

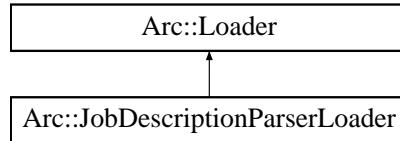

Abstract class for the different parsers. The `JobDescriptionParser` class is abstract which provide a interface for job description parsers. A job description parser should inherit this class and overwrite the `JobDescriptionParser::Parse` and `JobDescriptionParser::UnParse` methods.

The documentation for this class was generated from the following file:

- `JobDescriptionParser.h`

5.174 Arc::JobIdentificationType Class Reference

Job identification.

```
#include <JobDescription.h>
```

Data Fields

- std::string **JobName**
- std::string **Description**
- std::string **Type**
- std::list< std::string > **Annotation**
- std::list< std::string > **ActivityOldID**

5.174.1 Detailed Description

Job identification. This class serves to provide human readable information about a job description. Some of this information might also be passed to the execution service for providing information about the job created from this job description. An object of this class is part of the **JobDescription** class as the Identification public member.

5.174.2 Field Documentation

5.174.2.1 std::list<std::string> Arc::JobIdentificationType::ActivityOldID

ID of old activity. The ActivityOldID object is used to store a list of IDs corresponding to activities which were performed from this job description. This information is not intended to be used by the execution service, but rather used for keeping track of activities, e.g. when doing a job resubmission the old activity ID is appended to this list.

5.174.2.2 std::list<std::string> Arc::JobIdentificationType::Annotation

Annotation. The Annotation list is used for human readable comments, tags for free grouping or identifying different activities.

5.174.2.3 std::string Arc::JobIdentificationType::Description

Human readable description. The Description string can be used to provide a human readable description of e.g. the task which should be performed when processing the job description.

5.174.2.4 std::string Arc::JobIdentificationType::JobName

Name of job. The JobName string is used to specify a name of the job description, and it will most likely also be the name given to the job when created at the execution service.

5.174.2.5 std::string Arc::JobIdentificationType::Type

Job type. The Type string specifies a classification of the activity in compliance with [GLUE2](#). The possible values should follow those defined in the ComputingActivityType_t enumeration of [GLUE2](#).

Public Member Functions

- bool [IsFinished \(\) const](#)

5.176.1 Detailed Description

ARC general state model. The class comprise the general state model of the ARC-lib, and are herein used to compare job states from the different middlewares supported by the plugin structure of the ARC-lib. Which is why every ACC plugin should contain a class derived from this class. The derived class should consist of a constructor and a mapping function (a JobStateMap) which maps a std::string to a [JobState::StateType](#). An example of a constructor in a plugin could be: JobStatePlugin::JobStatePlugging(const std::string& state) : JobState(state, &pluginStateMap) {} where &pluginStateMap is a reference to the JobStateMap defined by the derived class.

5.176.2 Member Function Documentation

5.176.2.1 bool Arc::JobState::IsFinished () const [inline]

Check if state is finished.

Returns:

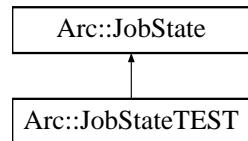

true is returned if the StateType is equal to FINISHED, KILLED, FAILED or DELETED, otherwise false is returned.

The documentation for this class was generated from the following file:

- JobState.h

5.178.1 Detailed Description

% JobSupervisor class The `JobSupervisor` class is tool for loading `JobControllerPlugin` plugins for managing Grid jobs.

5.178.2 Constructor & Destructor Documentation

5.178.2.1 Arc::JobSupervisor::JobSupervisor (`const UserConfig & usercfg, const std::list< Job > & jobs = std::list< Job >()`)

Create a `JobSupervisor`. The list of `Job` objects passed to the constructor will be managed by this `JobSupervisor`, through the `JobControllerPlugin` class. It is important that the `InterfaceName` member of each `Job` object is set and names a interface supported by one of the available `JobControllerPlugin` plugins. The `JobControllerPlugin` plugin will be loaded using the `JobControllerPluginLoader` class, loading a plugin of type "HED:JobControllerPlugin" which supports the particular interface, and the a reference to the `UserConfig` object `usercfg` will be passed to the plugin. Additionally a reference to the `UserConfig` object `usercfg` will be stored, thus `usercfg` must exist throughout the scope of the created object. If the `InterfaceName` member of a `Job` object is unset, a `VERBOSE` log message will be reported and that `Job` object will be ignored. If the `JobControllerPlugin` plugin for a given interface cannot be loaded, a `WARNING` log message will be reported and any `Job` object requesting that interface will be ignored. If loading of a specific plugin failed, that plugin will not be tried loaded for subsequent `Job` objects requiring that plugin. `Job` objects will be added to the corresponding `JobControllerPlugin` plugin, if loaded successfully.

Parameters:

`usercfg` `UserConfig` object to pass to `JobControllerPlugin` plugins and to use in member methods.

`jobs` List of `Job` objects which will be managed by the created object.

5.178.3 Member Function Documentation

5.178.3.1 bool Arc::JobSupervisor::AddJob (const Job & *job*)

Add job. Add [Job](#) object to this [JobSupervisor](#) for job management. The [Job](#) object will be passed to the corresponding specialized [JobControllerPlugin](#).

Parameters:

job [Job](#) object to add for job management

Returns:

true is returned if the passed [Job](#) object was added to the underlying [JobControllerPlugin](#), otherwise false is returned and a log message emitted with the reason.

5.178.3.2 bool Arc::JobSupervisor::Cancel ()

Cancel jobs. This method cancels jobs managed by this [JobSupervisor](#).

Before identifying jobs to cancel, the [JobControllerPlugin::UpdateJobs](#) method is called for each loaded [JobControllerPlugin](#) in order to retrieve the most up to date job information.

Since jobs in the [JobState::DELETED](#), [JobState::FINISHED](#), [JobState::KILLED](#) or [JobState::FAILED](#) states is already in a terminal state, a cancel request will not be send for those. Also no request will be send for jobs in the [JobState::UNDEFINED](#) state, since job information is not available. If the status-filter is non-empty, a cancel request will only be send to jobs with a general or specific state (see [JobState](#)) identical to any of the entries in the status-filter, excluding the states mentioned above.

For each job to be cancelled, the specialized [JobControllerPlugin::CancelJob](#) method is called and is responsible for cancelling the given job. If the method fails to cancel a job, this method will return false (otherwise true), and the job ID ([IDFromEndpoint](#)) of such jobs is appended to the [notcancelled](#) list. The job ID of successfully cancelled jobs will be appended to the passed [cancelled](#) list.

Returns:

false if any call to [JobControllerPlugin::CancelJob](#) failed, true otherwise.

See also:

[JobControllerPlugin::CancelJob](#).

5.178.3.3 bool Arc::JobSupervisor::Clean ()

Clean jobs. This method removes from services jobs managed by this [JobSupervisor](#). Before cleaning jobs, the [JobController::GetInformation](#) method is called in order to update job information, and that jobs are selected by job status instead of by job IDs. The status list argument should contain states for which cleaning of job in any of those states should be carried out. The states are compared using both the [JobState::operator\(\)](#) and [JobState::GetGeneralState\(\)](#) methods. If the status list is empty, all jobs will be selected for cleaning.

Returns:

false if calls to [JobControllerPlugin::CleanJob](#) fails, true otherwise.

5.178.3.4 `std::list<Job> Arc::JobSupervisor::GetJobs (bool includeJobsWithoutStatus = true)`

Get list of managed jobs. The list of jobs managed by this `JobSupervisor` is returned when calling this method. If the `includeJobsWithoutStatus` argument is set to false, only `Job` objects with a valid State attribute is returned.

Parameters:

`includeJobWithoutStatus` specifies whether jobs with invalid status should be included in the returned list

Returns:

list of `Job` objects managed by this `JobSupervisor`

See also:

`JobState::operator bool`

5.178.3.5 `bool Arc::JobSupervisor::Migrate (bool forcemigration, const std::list< Endpoint > &, std::list< Job > & migratedJobs, const std::list< std::string > & = std::list< std::string >())`

Migrate jobs. Jobs managed by this `JobSupervisor` will be migrated when invoking this method, that is the job description of a job will be tried obtained, and if successful a job migration request will be sent, based on that job description.

Before identifying jobs to be migrated, the `JobControllerPlugin::UpdateJobs` method is called for each loaded `JobControllerPlugin` in order to retrieve the most up to date job information. Only jobs for which the State member of the `Job` object has the value `JobState::QUEUEING`, will be considered for migration. Furthermore the job description must be obtained (either locally or remote) and successfully parsed in order for a job to be migrated. If the job description cannot be obtained or parsed an ERROR log message is reported, and the `IDFromEndpoint URL` of the `Job` object is appended to the notmigrated list. If no jobs have been identified for migration, false will be returned in case ERRORS were reported, otherwise true is returned.

The execution services which can be targeted for migration are those specified in the `UserConfig` object of this class, as selected services. Before initiating any job migration request, resource discovery and broker* loading is carried out using the `TargetGenerator` and `Broker` classes, initialised by the `UserConfig` object of this class. If `Broker` loading fails, or no `ExecutionTargets` are found, an ERROR log message is reported and all `IDFromEndpoint URLs` for job considered for migration will be appended to the notmigrated list and then false will be returned.

When the above checks have been carried out successfully, the following is done for each job considered for migration. The `ActivityOldID` member of the `Identification` member in the job description will be set to that of the `Job` object, and the `IDFromEndpoint URL` will be appended to `ActivityOldID` member of the job description. After that the `Broker` object will be used to find a suitable `ExecutionTarget` object, and if found a migrate request will tried sent using the `ExecutionTarget::Migrate` method, passing the `UserConfig` object of this class. The passed `forcemigration` boolean indicates whether the migration request at the service side should ignore failures in cancelling the existing queuing job. If the request succeeds, the corresponding new `Job` object is appended to the `migratedJobs` list. If no suitable `ExecutionTarget` objects are found an ERROR log message is reported and the `IDFromEndpoint URL` of the `Job` object is appended to the notmigrated list. When all jobs have been processed, false is returned if any ERRORS were reported, otherwise true.

Parameters:

forcemigration indicates whether migration should succeed if service fails to cancel the existing queuing job.

migratedJobs list of [Job](#) objects which migrated jobs will be appended to.

TODO

Returns:

false if any error is encountered, otherwise true.

5.178.3.6 bool Arc::JobSupervisor::Renew ()

Renew job credentials. This method will renew credentials of jobs managed by this [JobSupervisor](#).

Before identifying jobs for which to renew credentials, the [JobControllerPlugin::UpdateJobs](#) method is called for each loaded [JobControllerPlugin](#) in order to retrieve the most up to date job information.

Since jobs in the [JobState::DELETED](#), [JobState::FINISHED](#) or [JobState::KILLED](#) states is in a terminal state credentials for those jobs will not be renewed. Also jobs in the [JobState::UNDEFINED](#) state will not get their credentials renewed, since job information is not available. The [JobState::FAILED](#) state is also a terminal state, but since jobs in this state can be restarted, credentials for such jobs can be renewed. If the status-filter is non-empty, a renewal of credentials will be done for jobs with a general or specific state (see [JobState](#)) identical to any of the entries in the status-filter, excluding the already filtered states as mentioned above.

For each job for which to renew credentials, the specialized [JobControllerPlugin::RenewJob](#) method is called and is responsible for renewing the credentials for the given job. If the method fails to renew any job credentials, this method will return false (otherwise true), and the job ID ([IDFromEndpoint](#)) of such jobs is appended to the notrenewed list. The job ID of successfully renewed jobs will be appended to the passed renewed list.

Returns:

false if any call to [JobControllerPlugin::RenewJob](#) fails, true otherwise.

See also:

[JobControllerPlugin::RenewJob](#).

5.178.3.7 bool Arc::JobSupervisor::Resubmit (int *destination*, const std::list< Endpoint > &, std::list< Job > & *resubmittedJobs*, const std::list< std::string > & = std::list< std::string >())

Resubmit jobs. Jobs managed by this [JobSupervisor](#) will be resubmitted when invoking this method, that is the job description of a job will be tried obtained, and if successful a new job will be submitted.

Before identifying jobs to be resubmitted, the [JobControllerPlugin::UpdateJobs](#) method is called for each loaded [JobControllerPlugin](#) in order to retrieve the most up to date job information. If an empty status-filter is specified, all jobs managed by this [JobSupervisor](#) will be considered for resubmission, except jobs in the undefined state (see [JobState](#)). If the status-filter is not empty, then only jobs with a general or specific state (see [JobState](#)) identical to any of the entries in the status-filter will be considered, except jobs in the undefined state. Jobs for which a job description cannot be obtained and successfully parsed will not be considered and an ERROR log message is reported, and the [IDFromEndpoint](#) [URL](#) is appended to the notresubmitted list. [Job](#) descriptions will be tried obtained either from [Job](#) object itself, or fetching them

remotely. Furthermore if a [Job](#) object has the LocalInputFiles object set, then the checksum of each of the local input files specified in that object (key) will be calculated and verified to match the checksum LocalInputFiles object (value). If checksums are not matching the job will be filtered, and an ERROR log message is reported and the IDFromEndpoint [URL](#) is appended to the notresubmitted list. If no job have been identified for resubmission, false will be returned if ERRORS were reported, otherwise true is returned.

The destination for jobs is partly determined by the destination parameter. If a value of 1 is specified a job will only be targeted to the execution service (ES) on which it reside. A value of 2 indicates that a job should not be targeted to the ES it currently reside. Specifying any other value will target any ES. The ESs which can be targeted are those specified in the [UserConfig](#) object of this class, as selected services. Before initiating any job submission, resource discovery and broker loading is carried out using the TargetGenerator and [Broker](#) classes, initialised by the [UserConfig](#) object of this class. If [Broker](#) loading fails, or no ExecutionTargets are found, an ERROR log message is reported and all IDFromEndpoint URLs for job considered for resubmission will be appended to the notresubmitted list and then false will be returned.

When the above checks have been carried out successfully, then the [Broker::Submit](#) method will be invoked for each considered for resubmission. If it fails the IDFromEndpoint [URL](#) for the job is appended to the notresubmitted list, and an ERROR is reported. If submission succeeds the new job represented by a [Job](#) object will be appended to the resubmittedJobs list - it will not be added to this [JobSupervisor](#). The method returns false if ERRORS were reported otherwise true is returned.

Parameters:

destination specifies how target destination should be determined (1 = same target, 2 = not same, any other = any target).

resubmittedJobs list of [Job](#) objects which resubmitted jobs will be appended to.

TODO

Returns:

false if any error is encountered, otherwise true.

5.178.3.8 bool Arc::JobSupervisor::Resume ()

Resume jobs by status. This method resumes jobs managed by this [JobSupervisor](#).

Before identifying jobs to resume, the [JobControllerPlugin::UpdateJobs](#) method is called for each loaded [JobControllerPlugin](#) in order to retrieve the most up to date job information.

Since jobs in the [JobState::DELETED](#), [JobState::FINISHED](#) or [JobState::KILLED](#) states is in a terminal state credentials for those jobs will not be renewed. Also jobs in the [JobState::UNDEFINED](#) state will not be resumed, since job information is not available. The [JobState::FAILED](#) state is also a terminal state, but jobs in this state are allowed to be restarted. If the status-filter is non-empty, only jobs with a general or specific state (see [JobState](#)) identical to any of the entries in the status-filter will be resumed, excluding the already filtered states as mentioned above.

For each job to resume, the specialized [JobControllerPlugin::ResumeJob](#) method is called and is responsible for resuming the particular job. If the method fails to resume a job, this method will return false, otherwise true is returned. The job ID of successfully resumed jobs will be appended to the passed resummedJobs list.

Returns:

false if any call to [JobControllerPlugin::ResumeJob](#) fails, true otherwise.

See also:

JobControllerPlugin::ResumeJob.

5.178.3.9 bool Arc::JobSupervisor::Retrieve (const std::string & *downloadaddirprefix*, bool *usejobname*, bool *force*, std::list<std::string> & *downloadadirectories*)

Retrieve job output files. This method retrieves output files of jobs managed by this [JobSupervisor](#).

Before identifying jobs for which to retrieve output files, the JobControllerPlugin::UpdateJobs method is called for each loaded [JobControllerPlugin](#) in order to retrieve the most up to date job information. If an empty status-filter is specified, all jobs managed by this [JobSupervisor](#) will be considered for retrieval, except jobs in the undefined state (see [JobState](#)). If the status-filter is not empty, then only jobs with a general or specific state (see [JobState](#)) identical to any of the entries in the status-filter will be considered, except jobs in the undefined state. Jobs in the state [JobState::DELETED](#) and unfinished jobs (see [JobState::IsFinished](#)) will also not be considered.

For each of the jobs considered for retrieval, the files will be downloaded to a directory named either as the last part of the job ID or the job name, which is determined by the 'usejobname' argument. The download directories will be located in the directory specified by the 'downloadaddir' argument, as either a relative or absolute path. If the 'force' argument is set to 'true', and a download directory for a given job already exist it will be overwritten, otherwise files for that job will not be downloaded. This method calls the JobControllerPlugin::GetJob method in order to download jobs, and if a job is successfully retrieved the job ID will be appended to the 'retrievedJobs' list. If all jobs are successfully retrieved this method returns true, otherwise false.

Parameters:

downloadaddir specifies the path to in which job download directories will be located.

usejobname specifies whether to use the job name or job ID as directory name to store job output files in.

force indicates whether existing job directories should be overwritten or not.

See also:

JobControllerPlugin::RetrieveJob.

Returns:

true if all jobs are successfully retrieved, otherwise false.

5.178.3.10 void Arc::JobSupervisor::Update ()

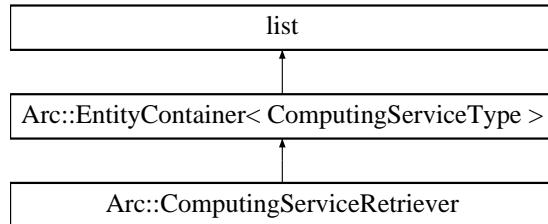

Update job information. When invoking this method the job information for the jobs managed by this [JobSupervisor](#) will be updated. Internally, for each loaded [JobControllerPlugin](#) the JobControllerPlugin::UpdateJobs method will be called, which will be responsible for updating job information.

```

Public Member Functions

- virtual void [log](#) (const [LogMessage](#) &message)=0

Protected Member Functions

- [LogDestination \(\)](#)
- [LogDestination \(const std::string &locale\)](#)

5.184.1 Detailed Description

A base class for log destinations. This class defines an interface for LogDestinations. [LogDestination](#) objects will typically contain synchronization mechanisms and should therefore never be copied.

5.184.2 Constructor & Destructor Documentation

5.184.2.1 Arc::LogDestination::LogDestination () [protected]

Default constructor. This destination will use the default locale.

5.184.2.2 Arc::LogDestination::LogDestination (const std::string & locale) [protected]

Constructor with specific locale. This destination will use the specified locale.

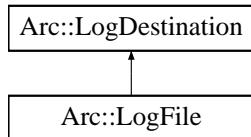

The documentation for this class was generated from the following file:

- [Logger.h](#)

5.185 Arc::LogFile Class Reference

A class for logging to files.

#include <Logger.h> Inheritance diagram for Arc::LogFile::

Public Member Functions

- [LogFile](#) (const std::string &path)
- [LogFile](#) (const std::string &path, const std::string &locale)
- void [setMaxSize](#) (int newsize)
- void [setBackups](#) (int newbackup)
- void [setReopen](#) (bool newreopen)
- operator bool (void)
- bool [operator!](#) (void)
- virtual void [log](#) (const [LogMessage](#) &message)

5.185.1 Detailed Description

A class for logging to files. This class is used for logging to files. It provides synchronization in order to prevent different LogMessages to appear mixed with each other in the stream. It is possible to limit size of created file. Whenever specified size is exceeded file is deleted and new one is created. Old files may be moved into backup files instead of being deleted. Those files have names same as initial file with additional number suffix - similar to those found in /var/log of many Unix-like systems.

5.185.2 Constructor & Destructor Documentation

5.185.2.1 Arc::LogFile::LogFile (const std::string & path)

Creates a [LogFile](#) connected to a file. Creates a [LogFile](#) connected to the file located at specified path. In order not to break synchronization, it is important not to connect more than one [LogFile](#) object to a certain file. If file does not exist it will be created.

Parameters:

path The path to file to which to write LogMessages.

5.185.2.2 Arc::LogFile::LogFile (const std::string & path, const std::string & locale)

Creates a [LogFile](#) connected to a file. Creates a [LogFile](#) connected to the file located at specified path. The output will be localised to the specified locale.

5.185.3 Member Function Documentation

5.185.3.1 virtual void Arc::LogFile::log (const LogMessage & *message*) [virtual]

Writes a [LogMessage](#) to the file. This method writes a [LogMessage](#) to the file that is connected to this [LogFile](#) object. If after writing size of file exceeds one set by [setMaxSize\(\)](#) file is moved to backup and new one is created.

Parameters:

message The [LogMessage](#) to write.

Implements [Arc::LogDestination](#).

5.185.3.2 void Arc::LogFile::setBackups (int *newbackup*)

Set number of backups to store. Set number of backups to store. When file size exceeds one specified with [setMaxSize\(\)](#) file is closed and moved to one named path.1. If path.1 exists it is moved to path.2 and so on. Number of path.# files is one set in newbackup.

Parameters:

newbackup Number of backup files.

5.185.3.3 void Arc::LogFile::setMaxSize (int *newsized*)

Set maximal allowed size of file. Set maximal allowed size of file. This value is not obeyed exactly. Specified size may be exceeded by amount of one [LogMessage](#). To disable limit specify -1.

Parameters:

newsized Max size of log file.

5.185.3.4 void Arc::LogFile::setReopen (bool *newreopen*)

Set file reopen on every write. Set file reopen on every write. If set to true file is opened before writing every log record and closed afterward.

Parameters:

newreopen If file to be reopened for every log record.

The documentation for this class was generated from the following file:

- Logger.h

5.186 Arc::Logger Class Reference

A logger class.

```
#include <Logger.h>
```

Public Member Functions

- `Logger (Logger &parent, const std::string &subdomain)`

- `void setThreshold (LogLevel threshold)`
- `LogLevel getThreshold () const`
- `void setThreadContext (void)`
- `void msg (LogMessage message)`
- `void msg (LogLevel level, const std::string &str)`

Static Public Member Functions

- static `Logger & getRootLogger ()`
- static void `setThresholdForDomain (LogLevel threshold, const std::list< std::string > &subdomains)`
- static void `setThresholdForDomain (LogLevel threshold, const std::string &domain)`

5.186.1 Detailed Description

A logger class. This class defines a `Logger` to which LogMessages can be sent.

Every `Logger` (except for the rootLogger) has a parent `Logger`. The domain of a `Logger` (a string that indicates the origin of LogMessages) is composed by adding a subdomain to the domain of its parent `Logger`.

A `Logger` also has a threshold. Every `LogMessage` that have a level that is greater than or equal to the threshold is forwarded to any `LogDestination` connected to this `Logger` as well as to the parent `Logger`.

Typical usage of the `Logger` class is to declare a global `Logger` object for each library/module/component to be used by all classes and methods there.

5.186.2 Constructor & Destructor Documentation

5.186.2.1 Arc::Logger::Logger (`Logger & parent, const std::string & subdomain`)

Creates a logger. Creates a logger. The threshold is inherited from its parent `Logger`.

Parameters:

- `parent` The parent `Logger` of the new `Logger`.
- `subdomain` The subdomain of the new logger.

5.186.2.2 Arc::Logger::Logger (*Logger & parent, const std::string & subdomain, LogLevel threshold*)

Creates a logger. Creates a logger.

Parameters:

parent The parent [Logger](#) of the new [Logger](#).

subdomain The subdomain of the new logger.

threshold The threshold of the new logger.

5.186.2.3 Arc::Logger::~Logger ()

Destroys a logger. Destructor

5.186.3 Member Function Documentation

5.186.3.1 void Arc::Logger::addDestination (*LogDestination & destination*)

Adds a [LogDestination](#). Adds a [LogDestination](#) to which to forward LogMessages sent to this logger (if they pass the threshold). Since LogDestinatoins should not be copied, the new [LogDestination](#) is passed by reference and a pointer to it is kept for later use. It is therefore important that the [LogDestination](#) passed to this [Logger](#) exists at least as long as the [Logger](#) itslef.

5.186.3.2 void Arc::Logger::addDestinations (*const std::list< LogDestination * > & destinations*)

Adds LogDestinations. See [addDestination\(LogDestination& destination\)](#).

5.186.3.3 const std::list<LogDestination*>& Arc::Logger::getDestinations (*void*) const

Obtains current LogDestinations. Returns list of pointers to [LogDestination](#) objects. Returned result refers directly to internal member of [Logger](#) intance. Hence it should not be used after this [Logger](#) is destroyed.

5.186.3.4 static Logger& Arc::Logger::getRootLogger () [static]

The root [Logger](#). This is the root [Logger](#). It is an ancestor of any other [Logger](#) and allways exists.

5.186.3.5 LogLevel Arc::Logger::getThreshold () const

Returns the threshold. Returns the threshold.

Returns:

The threshold of this [Logger](#).

5.186.3.6 void Arc::Logger::msg (LogLevel *level*, const std::string & *str*) [inline]

Logs a message text. Logs a message text string at the specified LogLevel. This is a convenience method to save some typing. It simply creates a [LogMessage](#) and sends it to the other [msg\(\)](#) method.

Parameters:

level The level of the message.

str The message text.

References [msg\(\)](#).

5.186.3.7 void Arc::Logger::msg (LogMessage *message*)

Sends a [LogMessage](#). Sends a [LogMessage](#).

Parameters:

The LogMessage to send.

Referenced by [msg\(\)](#), and [Arc::stringto\(\)](#).

5.186.3.8 void Arc::Logger::setThreadContext (void)

Creates per-thread context. Creates new context for this logger which becomes effective for operations initiated by this thread. All new threads started by this one will inherit new context. Context stores current threshold and pointers to destinations. Hence new context is identical to current one. One can modify new context using [setThreshold\(\)](#), [removeDestinations\(\)](#) and [addDestination\(\)](#). All such operations will not affect old context.

5.186.3.9 void Arc::Logger::setThreshold (LogLevel *threshold*)

Sets the threshold. This method sets the threshold of the [Logger](#). Any message sent to this [Logger](#) that has a level below this threshold will be discarded.

Parameters:

The threshold

5.186.3.10 static void Arc::Logger::setThresholdForDomain (LogLevel *threshold*, const std::string & *domain*) [static]

Sets the threshold for domain. This method sets the default threshold of the domain. All new loggers created with specified domain will have specified threshold set by default. The domain is composed of all subdomains of all loggers in chain by merging them with '.' as separator.

Parameters:

threshold The threshold

domain The domain of logger

5.186.3.11 static void Arc::Logger::setThresholdForDomain (LogLevel *threshold*, const std::list< std::string > & *subdomains*) [static]

Sets the threshold for domain. This method sets the default threshold of the domain. All new loggers created with specified domain will have specified threshold set by default. The subdomains of all loggers in chain are matched against list of provided subdomains.

Parameters:

threshold The threshold

subdomains The subdomains of all loggers in chain

The documentation for this class was generated from the following file:

- Logger.h

5.187 Arc::LoggerContext Class Reference

Container for logger configuration.

```
#include <Logger.h>
```

5.187.1 Detailed Description

Container for logger configuration.

The documentation for this class was generated from the following file:

5.188 Arc::LoggerFormat Struct Reference

The documentation for this struct was generated from the following file:

- `Logger.h`

5.189 Arc::LogMessage Class Reference

A class for log messages.

```
#include <Logger.h>
```

Public Member Functions

- `LogMessage (LogLevel level, const IString &message)`
- `LogMessage (LogLevel level, const IString &message, const std::string &identifier)`
- `LogLevel getLevel () const`

Protected Member Functions

- `void setIdentifier (std::string identifier)`

Friends

- class `Logger`
- `std::ostream & operator<< (std::ostream &os, const LogMessage &message)`

5.189.1 Detailed Description

A class for log messages. This class is used to represent log messages internally. It contains the time the message was created, its level, from which domain it was sent, an identifier and the message text itself.

5.189.2 Constructor & Destructor Documentation

5.189.2.1 Arc::LogMessage::LogMessage (`LogLevel level, const IString & message`)

Creates a `LogMessage` with the specified level and message text. This constructor creates a `LogMessage` with the specified level and message text. The time is set automatically, the domain is set by the `Logger` to which the `LogMessage` is sent and the identifier is composed from the process ID and the address of the Thread object corresponding to the calling thread.

Parameters:

- level* The level of the `LogMessage`.
- message* The message text.

5.189.2.2 Arc::LogMessage::LogMessage (`LogLevel level, const IString & message, const std::string & identifier`)

Creates a `LogMessage` with the specified attributes. This constructor creates a `LogMessage` with the specified level, message text and identifier. The time is set automatically and the domain is set by the `Logger` to which the `LogMessage` is sent.

Parameters:

- level* The level of the `LogMessage`.

message The message text.

ident The identifier of the [LogMessage](#).

5.189.3 Member Function Documentation

5.189.3.1 LogLevel Arc::LogMessage::getLevel () const

Returns the level of the [LogMessage](#). Returns the level of the [LogMessage](#).

Returns:

The level of the [LogMessage](#).

5.189.3.2 void Arc::LogMessage::setIdentifier (std::string *identifier*) [protected]

Sets the identifier of the [LogMessage](#). The purpose of this method is to allow subclasses (in case there are any) to set the identifier of a [LogMessage](#).

Parameters:

The identifier.

5.189.4 Friends And Related Function Documentation

5.189.4.1 friend class Logger [friend]

The [Logger](#) class is a friend. The [Logger](#) class must have some privileges (e.g. ability to call the `setDomain()` method), therefore it is a friend.

5.189.4.2 std::ostream& operator<< (std::ostream & *os*, const LogMessage & *message*) [friend]

Printing of LogMessages to ostreams. Output operator so that LogMessages can be printed conveniently by LogDestinations.

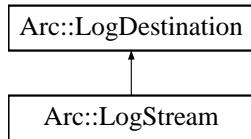

The documentation for this class was generated from the following file:

- [Logger.h](#)

5.190 Arc::LogStream Class Reference

A class for logging to ostreams.

```
#include <Logger.h>Inheritance diagram for Arc::LogStream::
```

Public Member Functions

- [LogStream \(std::ostream &destination\)](#)
- [LogStream \(std::ostream &destination, const std::string &locale\)](#)
- virtual void [log \(const LogMessage &message\)](#)

5.190.1 Detailed Description

A class for logging to ostreams. This class is used for logging to ostreams (cout, cerr, files). It provides synchronization in order to prevent different LogMessages to appear mixed with each other in the stream. In order not to break the synchronization, LogStreams should never be copied. Therefore the copy constructor and assignment operator are private. Furthermore, it is important to keep a [LogStream](#) object as long as the [Logger](#) to which it has been registered.

5.190.2 Constructor & Destructor Documentation

5.190.2.1 Arc::LogStream::LogStream (std::ostream & destination)

Creates a [LogStream](#) connected to an ostream. Creates a [LogStream](#) connected to the specified ostream. In order not to break synchronization, it is important not to connect more than one [LogStream](#) object to a certain stream.

Parameters:

destination The ostream to which to write LogMessages.

5.190.2.2 Arc::LogStream::LogStream (std::ostream & destination, const std::string & locale)

Creates a [LogStream](#) connected to an ostream. Creates a [LogStream](#) connected to the specified ostream. The output will be localised to the specified locale.

5.190.3 Member Function Documentation

5.190.3.1 virtual void Arc::LogStream::log (const LogMessage & message) [virtual]

Writes a [LogMessage](#) to the stream. This method writes a [LogMessage](#) to the ostream that is connected to this [LogStream](#) object. It is synchronized so that not more than one [LogMessage](#) can be written at a time.

Parameters:

message The [LogMessage](#) to write.

Implements [Arc::LogDestination](#).

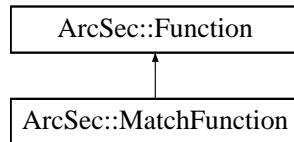

The documentation for this class was generated from the following file:

- [Logger.h](#)

5.191 ArcSec::MatchFunction Class Reference

Evaluate whether arg1 (value in regular expression) matched arg0 (lable in regular expression).

```
#include <MatchFunction.h>
```

Public Member Functions

- virtual `AttributeValue * evaluate (AttributeValue *arg0, AttributeValue *arg1, bool check_id=true)`
- virtual `std::list<AttributeValue * > evaluate (std::list<AttributeValue * > args, bool check_id=true)`

Static Public Member Functions

- static `std::string getFunctionName (std::string datatype)`

5.191.1 Detailed Description

Evaluate whether arg1 (value in regular expression) matched arg0 (lable in regular expression).

5.191.2 Member Function Documentation

5.191.2.1 virtual std::list<AttributeValue*> ArcSec::MatchFunction::evaluate (std::list<AttributeValue * > args, bool check_id = true) [virtual]

Evaluate a list of `AttributeValue` objects, and return a list of Attribute objects

Implements `ArcSec::Function`.

5.191.2.2 virtual AttributeValue* ArcSec::MatchFunction::evaluate (AttributeValue * arg0, AttributeValue * arg1, bool check_id = true) [virtual]

Evaluate two `AttributeValue` objects, and return one `AttributeValue` object

Implements `ArcSec::Function`.

5.191.2.3 static std::string ArcSec::MatchFunction::getFunctionName (std::string datatype) [static]

help function to get the FunctionName

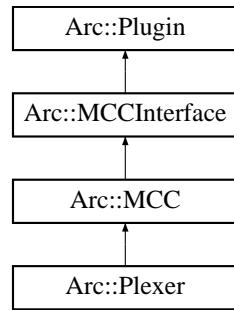

The documentation for this class was generated from the following file:

- MatchFunction.h

5.192 Arc::MCC Class Reference

Message Chain Component - base class for every [MCC](#) plugin.

#include <MCC.h> Inheritance diagram for Arc::MCC::

Public Member Functions

- [MCC \(Config *, PluginArgument *arg\)](#)
- virtual void [Next \(MCCInterface *next, const std::string &label=""\)](#)
- virtual void [AddSecHandler \(Config *cfg, ArcSec::SecHandler *sechandler, const std::string &label=""\)](#)

Protected Attributes

- std::map< std::string, [MCCInterface * > next_](#)
- std::map< std::string, std::list< [ArcSec::SecHandler * > > sechandlers_](#)

Static Protected Attributes

- static [Logger logger](#)

5.192.1 Detailed Description

Message Chain Component - base class for every [MCC](#) plugin. This is partially virtual class which defines interface and common functionality for every [MCC](#) plugin needed for managing of component in a chain.

5.192.2 Constructor & Destructor Documentation

5.192.2.1 Arc::MCC::MCC (Config *, PluginArgument * *arg*) [inline]

Example constructor - [MCC](#) takes at least it's configuration subtree

5.192.3 Member Function Documentation

5.192.3.1 virtual void Arc::MCC::AddSecHandler (Config * *cfg*, ArcSec::SecHandler * *sechandler*, const std::string & *label* = "") [virtual]

Add security components/handlers to this [MCC](#). Security handlers are stacked into a few queues with each queue identified by its label. The queue labelled 'incoming' is executed for every 'request' message after the message is processed by the [MCC](#) on the service side and before processing on the client side. The queue labelled 'outgoing' is run for response message before it is processed by [MCC](#) algorithms on the service side and after processing on the client side. Those labels are just a matter of agreement and some MCCs may implement different queues executed at various message processing steps.

5.192.3.2 virtual void Arc::MCC::Next (MCCIInterface * *next*, const std::string & *label* = "") [virtual]

Add reference to next [MCC](#) in chain. This method is called by [Loader](#) for every potentially labeled link to next component which implements [MCCIInterface](#). If next is NULL corresponding link is removed.

Reimplemented in [Arc::Plexer](#).

5.192.3.3 virtual MCC_Status Arc::MCC::process (Message &, Message &) [inline, virtual]

Dummy [Message](#) processing method. Just a placeholder.

Implements [Arc::MCCIInterface](#).

Reimplemented in [Arc::Plexer](#).

5.192.3.4 bool Arc::MCC::ProcessSecHandlers (Message & *message*, const std::string & *label* = "") const [protected]

Executes security handlers of specified queue. Returns true if the message is authorized for further processing or if there are no security handlers which implement authorization functionality. This is a convenience method and has to be called by the implementation of the [MCC](#).

5.192.3.5 virtual void Arc::MCC::Unlink () [virtual]

Removing all links. Useful for destroying chains.

5.192.4 Field Documentation

5.192.4.1 Logger Arc::MCC::logger [static, protected]

A logger for MCCs. A logger intended to be the parent of loggers in the different MCCs.

Reimplemented in [Arc::Plexer](#).

5.192.4.2 std::map<std::string, MCCInterface *> Arc::MCC::next_ [protected]

Set of labeled "next" components. Each implemented [MCC](#) must call [process\(\)](#) method of corresponding [MCCInterface](#) from this set in own [process\(\)](#) method.

5.192.4.3 std::map<std::string, std::list<ArcSec::SecHandler *> > Arc::MCC::sechandlers_ [protected]

Set of labeled authentication and authorization handlers. [MCC](#) calls sequence of handlers at specific point depending on associated identifier. In most cases those are "in" and "out" for incoming and outgoing messages correspondingly.

The documentation for this class was generated from the following file:

- [MCC.h](#)

5.193 Arc::MCC_Status Class Reference

A class for communication of [MCC](#) processing results.

```
#include <MCC_Status.h>
```

Public Member Functions

- [MCC_Status](#) ([StatusKind](#) kind=STATUS_UNDEFINED, const std::string &origin="???", const std::string &explanation="No explanation.")
- bool [isOk](#) () const
- [StatusKind](#) [getKind](#) () const
- const std::string & [getOrigin](#) () const
- const std::string & [getExplanation](#) () const
- [operator std::string](#) () const
- [operator bool](#) (void) const
- bool [operator!](#) (void) const

5.193.1 Detailed Description

A class for communication of [MCC](#) processing results. This class is used to communicate result status between MCCs. It contains a status kind, a string specifying the origin ([MCC](#)) of the status object and an explanation.

5.193.2 Constructor & Destructor Documentation

5.193.2.1 [Arc::MCC_Status::MCC_Status](#) ([StatusKind](#) *kind* = STATUS_UNDEFINED, const std::string & *origin* = "???", const std::string & *explanation* = "No explanation.")

The constructor. Creates a [MCC_Status](#) object.

Parameters:

- kind* The StatusKind (default: STATUS_UNDEFINED)
origin The origin [MCC](#) (default: "??")
explanation An explanation (default: "No explanation.")

5.193.3 Member Function Documentation

5.193.3.1 const std::string& [Arc::MCC_Status::getExplanation](#) () const

Returns an explanation. This method returns an explanation of this object.

Returns:

An explanation of this object.

5.193.3.2 StatusKind Arc::MCC_Status::getKind () const

Returns the status kind. Returns the status kind of this object.

Returns:

The status kind of this object.

5.193.3.3 const std::string& Arc::MCC_Status::getOrigin () const

Returns the origin. This method returns a string specifying the origin [MCC](#) of this object.

Returns:

A string specifying the origin [MCC](#) of this object.

5.193.3.4 bool Arc::MCC_Status::isOk () const

Is the status kind ok? This method returns true if the status kind of this object is STATUS_OK

Returns:

true if kind==STATUS_OK

Referenced by operator bool(), and operator!().

5.193.3.5 Arc::MCC_Status::operator bool (void) const [inline]

Is the status kind ok? This method returns true if the status kind of this object is STATUS_OK

Returns:

true if kind==STATUS_OK

References [isOk\(\)](#).

5.193.3.6 Arc::MCC_Status::operator std::string () const

Conversion to string. This operator converts a [MCC_Status](#) object to a string.

5.193.3.7 bool Arc::MCC_Status::operator! (void) const [inline]

not operator Returns true if the status kind is not OK

Returns:

true if kind!=STATUS_OK

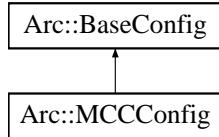

References [isOk\(\)](#).

The documentation for this class was generated from the following file:

- [MCC_Status.h](#)

5.194 Arc::MCCConfig Class Reference

Inheritance diagram for Arc::MCCConfig::

Public Member Functions

- virtual [XMLNode MakeConfig \(XMLNode cfg\) const](#)

5.194.1 Member Function Documentation

5.194.1.1 virtual XMLNode Arc::MCCConfig::MakeConfig (XMLNode *cfg*) const [virtual]

Adds configuration part corresponding to stored information into common configuration tree supplied in 'cfg' argument. Returns reference to XML node representing configuration of [ModuleManager](#)

Reimplemented from [Arc::BaseConfig](#).

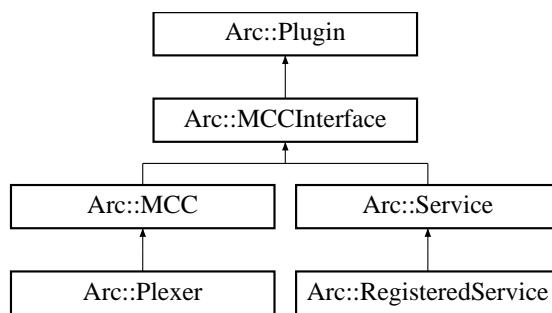

The documentation for this class was generated from the following file:

- [MCC.h](#)

5.195 Arc::MCCInterface Class Reference

Interface for communication between [MCC](#), [Service](#) and [Plexer](#) objects.

```
#include <MCC.h>
```

Public Member Functions

- virtual [MCC_Status](#) process ([Message](#) &request, [Message](#) &response)=0

5.195.1 Detailed Description

Interface for communication between [MCC](#), [Service](#) and [Plexer](#) objects. The Interface consists of the method [process\(\)](#) which is called by the previous [MCC](#) in the chain. For memory management policies please read the description of the [Message](#) class.

5.195.2 Member Function Documentation

5.195.2.1 virtual [MCC_Status](#) Arc::MCCInterface::process ([Message](#) & *request*, [Message](#) & *response*) [pure virtual]

Method for processing of requests and responses. This method is called by preceding [MCC](#) in chain when a request needs to be processed. This method must call similar method of next [MCC](#) in chain unless any failure happens. Result returned by call to next [MCC](#) should be processed and passed back to previous [MCC](#). In case of failure this method is expected to generate valid error response and return it back to previous [MCC](#) without calling the next one.

Parameters:

request The request that needs to be processed.

response A [Message](#) object that will contain the response of the request when the method returns.

Returns:

An object representing the status of the call.

Implemented in [Arc::MCC](#), and [Arc::Plexer](#).

The documentation for this class was generated from the following file:

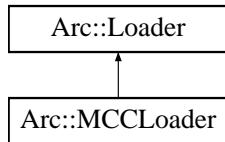

- [MCC.h](#)

5.196 Arc::MCCLoader Class Reference

Creator of [Message Component Chains \(MCC\)](#).

```
#include <MCCLoader.h>
```

Inheritance diagram for Arc::MCCLoader:::

Public Member Functions

- [MCCLoader \(Config &cfg\)](#)
- [~MCCLoader \(\)](#)
- [MCC * operator\[\] \(const std::string &id\)](#)

5.196.1 Detailed Description

Creator of [Message Component Chains \(MCC\)](#). This class processes XML configuration and creates message chains. Accepted configuration is defined by XML schema mcc.xsd. Supported components are of types [MCC](#), [Service](#) and [Plexer](#). [MCC](#) and [Service](#) are loaded from dynamic libraries. For [Plexer](#) only internal implementation is supported. This object is also a container for loaded components. All components and chains are destroyed if this object is destroyed. Chains are created in 2 steps. First all components are loaded and corresponding objects are created. Constructors are supplied with corresponding configuration subtrees. During next step components are linked together by calling their Next() methods. Each call creates labeled link to next component in a chain. 2 step method has an advantage over single step because it allows loops in chains and makes loading procedure more simple. But that also means during short period of time components are only partly configured. Components in such state must produce proper error response if [Message](#) arrives. Note: Current implementation requires all components and links to be labeled. All labels must be unique. Future implementation will be able to assign labels automatically.

5.196.2 Constructor & Destructor Documentation

5.196.2.1 Arc::MCCLoader::MCCLoader (Config & cfg)

Constructor that takes whole XML configuration and creates component chains

5.196.2.2 Arc::MCCLoader::~MCCLoader ()

Destructor destroys all components created by constructor

5.196.3 Member Function Documentation

5.196.3.1 MCC* Arc::MCCLoader::operator[] (const std::string & id)

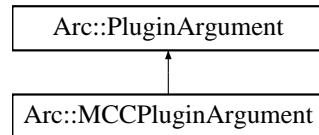

Access entry MCCs in chains. Those are components exposed for external access using 'entry' attribute

The documentation for this class was generated from the following file:

- MCCLoader.h

5.197 Arc::MCCPluginArgument Class Reference

Inheritance diagram for Arc::MCCPluginArgument::

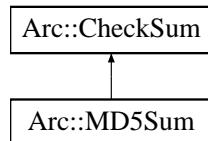

The documentation for this class was generated from the following file:

- MCC.h

5.198 Arc::MD5Sum Class Reference

Implementation of MD5 checksum.

```
#include <CheckSum.h>
```

Public Member Functions

- virtual void `start` (void)
- virtual void `add` (void **buf*, unsigned long long int *len*)
- virtual void `end` (void)
- virtual void `result` (unsigned char *&*res*, unsigned int &*len*) const
- virtual int `print` (char **buf*, int *len*) const
- virtual void `scan` (const char **buf*)
- virtual operator bool (void) const
- virtual bool `operator!` (void) const

5.198.1 Detailed Description

Implementation of MD5 checksum. This class is a specialized class of the [CheckSum](#) class. It provides an implementation of the MD5 message-digest algorithm specified in RFC 1321.

5.198.2 Member Function Documentation

5.198.2.1 virtual void Arc::MD5Sum::add (void * *buf*, unsigned long long int *len*) [virtual]

Add data to be checksummed. This method calculates the checksum of the passed data chuck, taking into account the previous state of this object.

Parameters:

- buf* pointer to data chuck to be checksummed.
len size of the data chuck.

Implements [Arc::CheckSum](#).

5.198.2.2 virtual void Arc::MD5Sum::end (void) [virtual]

Finalize the checksumming. This method finalizes the checksum algorithm, that is calculating the final checksum result.

Implements [Arc::CheckSum](#).

5.198.2.3 virtual int Arc::MD5Sum::print (char * buf, int len) const [virtual]

Retrieve result of checksum into a string. The passed string buf is filled with result of checksum algorithm in base 16. At most len characters are filled into buffer buf. The hexadecimal value is prepended with "<algorithm>:", where <algorithm> is one of "cksum", "md5" or "adler32" respectively corresponding to the result from the [CRC32Sum](#), [MD5Sum](#) and Adler32 classes.

Parameters:

buf pointer to buffer which should be filled with checksum result.
len max number of character filled into buffer.

Reimplemented from [Arc::CheckSum](#).

5.198.2.4 virtual void Arc::MD5Sum::scan (const char * buf) [virtual]

Set internal checksum state. This method sets the internal state to that of the passed textual representation. The format passed to this method must be the same as retrieved from the [CheckSum::print](#) method.

Parameters:

buf string containing textual representation of checksum

See also:

[CheckSum::print](#)

Implements [Arc::CheckSum](#).

5.198.2.5 virtual void Arc::MD5Sum::start (void) [virtual]

Initiate the checksum algorithm. This method must be called before starting a new checksum calculation.

Implements [Arc::CheckSum](#).

The documentation for this class was generated from the following file:

- CheckSum.h

5.199 Arc::Message Class Reference

Object being passed through chain of MCCs.

```
#include <Message.h>
```

Public Member Functions

- [Message \(void\)](#)
- [Message \(Message &msg\)](#)
- [Message \(long msg_ptr_addr\)](#)
- [~Message \(void\)](#)
- [Message & operator= \(Message &msg\)](#)
- [MessagePayload * Payload \(void\)](#)
- [MessagePayload * Payload \(MessagePayload *payload\)](#)
- [MessageAttributes * Attributes \(void\)](#)
- [MessageAuth * Auth \(void\)](#)
- [MessageContext * Context \(void\)](#)
- [MessageAuthContext * AuthContext \(void\)](#)
- [void Context \(MessageContext *ctx\)](#)
- [void AuthContext \(MessageAuthContext *auth_ctx\)](#)

5.199.1 Detailed Description

Object being passed through chain of MCCs. An instance of this class refers to objects with main content ([MessagePayload](#)), authentication/authorization information ([MessageAuth](#)) and common purpose attributes ([MessageAttributes](#)). [Message](#) class does not manage pointers to objects and their content. It only serves for grouping those objects. [Message](#) objects are supposed to be processed by MCCs and Services implementing [MCCIInterface](#) method process(). All objects constituting content of [Message](#) object are subject to following policies:

1. All objects created inside call to process() method using new command must be explicitly destroyed within same call using delete command with following exceptions. a) Objects which are assigned to 'response' [Message](#). b) Objects whose management is completely acquired by objects assigned to 'response' [Message](#).
2. All objects not created inside call to process() method are not explicitly destroyed within that call with following exception. a) Objects which are part of 'response' Method returned from call to next's process() method. Unless those objects are passed further to calling process(), of course.
3. It is not allowed to make 'response' point to same objects as 'request' does on entry to process() method. That is needed to avoid double destruction of same object. (Note: if in a future such need arises it may be solved by storing additional flags in [Message](#) object).
4. It is allowed to change content of pointers of 'request' [Message](#). Calling process() method must not rely on that object to stay intact.
5. Called process() method should either fill 'response' [Message](#) with pointers to valid objects or to keep them intact. This makes it possible for calling process() to preload 'response' with valid error message.

5.199.2 Constructor & Destructor Documentation

5.199.2.1 Arc::Message::Message (void) [inline]

true if auth_ctx_ was created internally Dummy constructor

5.199.2.2 Arc::Message::Message (Message & msg) [inline]

Copy constructor. Ensures shallow copy.

5.199.2.3 Arc::Message::Message (long msg_ptr_addr)

Copy constructor. Used by language bindigs

5.199.2.4 Arc::Message::~Message (void) [inline]

Destructor does not affect refered objects except those created internally

5.199.3 Member Function Documentation

5.199.3.1 MessageAttributes* Arc::Message::Attributes (void) [inline]

Returns a pointer to the current attributes object or creates it if no attributes object has been assigned.

Referenced by operator=().

5.199.3.2 MessageAuth* Arc::Message::Auth (void) [inline]

Returns a pointer to the current authentication/authorization object or creates it if no object has been assigned.

Referenced by operator=().

5.199.3.3 void Arc::Message::AuthContext (MessageAuthContext * auth_ctx) [inline]

Assigns auth* context object

5.199.3.4 MessageAuthContext* Arc::Message::AuthContext (void) [inline]

Returns a pointer to the current auth* context object or creates it if no object has been assigned.

Referenced by operator=().

5.199.3.5 void Arc::Message::Context (MessageContext * ctx) [inline]

Assigns message context object

5.199.3.6 MessageContext* Arc::Message::Context (void) [inline]

Returns a pointer to the current context object or creates it if no object has been assigned. Last case should happen only if first MCC in a chain is connectionless like one implementing UDP protocol.

Referenced by operator=().

5.199.3.7 Message& Arc::Message::operator= (Message & msg) [inline]

Assignment. Ensures shallow copy.

References Attributes(), Auth(), AuthContext(), and Context().

5.199.3.8 MessagePayload* Arc::Message::Payload (MessagePayload * payload) [inline]

Replaces payload with new one. Returns the old one.

5.199.3.9 MessagePayload* Arc::Message::Payload (void) [inline]

Returns pointer to current payload or NULL if no payload assigned.

The documentation for this class was generated from the following file:

- Message.h

5.200 Arc::MessageAttributes Class Reference

A class for storage of attribute values.

```
#include <MessageAttributes.h>
```

Public Member Functions

- [MessageAttributes \(\)](#)
- void [set](#) (const std::string &key, const std::string &value)
- void [add](#) (const std::string &key, const std::string &value)
- void [removeAll](#) (const std::string &key)
- void [remove](#) (const std::string &key, const std::string &value)
- int [count](#) (const std::string &key) const
- const std::string & [get](#) (const std::string &key) const
- [AttributeIterator getAll](#) (const std::string &key) const
- [AttributeIterator getAll](#) (void) const

Protected Attributes

- [AttrMap attributes_](#)

5.200.1 Detailed Description

A class for storage of attribute values. This class is used to store attributes of messages. All attribute keys and their corresponding values are stored as strings. Any key or value that is not a string must thus be represented as a string during storage. Furthermore, an attribute is usually a key-value pair with a unique key, but there may also be multiple such pairs with equal keys.

The key of an attribute is composed by the name of the [Message Chain Component \(MCC\)](#) which produce it and the name of the attribute itself with a colon (:) in between, i.e. MCC_Name:Attribute_Name. For example, the key of the "Content-Length" attribute of the [HTTP MCC](#) is thus "HTTP:Content-Length".

There are also "global attributes", which may be produced by different MCCs depending on the configuration. The keys of such attributes are NOT prefixed by the name of the producing [MCC](#). Before any new global attribute is introduced, it must be agreed upon by the core development team and added below. The global attributes decided so far are:

- Request-URI Identifies the service to which the message shall be sent. This attribute is produced by e.g. the [HTTP MCC](#) and used by the plexer for routing the message to the appropriate service.

5.200.2 Constructor & Destructor Documentation

5.200.2.1 Arc::MessageAttributes::MessageAttributes ()

The default constructor. This is the default constructor of the [MessageAttributes](#) class. It constructs an empty object that initially contains no attributes.

5.200.3 Member Function Documentation

5.200.3.1 void Arc::MessageAttributes::add (const std::string & *key*, const std::string & *value*)

Adds a value to an attribute. This method adds a new value to an attribute. Any previous value will be preserved, i.e. the attribute may become multiple valued.

Parameters:

key The key of the attribute.

value The (new) value of the attribute.

5.200.3.2 int Arc::MessageAttributes::count (const std::string & *key*) const

Returns the number of values of an attribute. Returns the number of values of an attribute that matches a certain key.

Parameters:

key The key of the attribute for which to count values.

Returns:

The number of values that corresponds to the key.

5.200.3.3 const std::string& Arc::MessageAttributes::get (const std::string & *key*) const

Returns the value of a single-valued attribute. This method returns the value of a single-valued attribute. If the attribute is not single valued (i.e. there is no such attribute or it is a multiple-valued attribute) an empty string is returned.

Parameters:

key The key of the attribute for which to return the value.

Returns:

The value of the attribute.

5.200.3.4 AttributeIterator Arc::MessageAttributes::getAll (const std::string & *key*) const

Access the value(s) of an attribute. This method returns an [AttributeIterator](#) that can be used to access the values of an attribute.

Parameters:

key The key of the attribute for which to return the values.

Returns:

An [AttributeIterator](#) for access of the values of the attribute.

5.200.3.5 void Arc::MessageAttributes::remove (const std::string & *key*, const std::string & *value*)

Removes one value of an attribute. This method removes a certain value from the attribute that matches a certain key.

Parameters:

- key* The key of the attribute from which the value shall be removed.
value The value to remove.

5.200.3.6 void Arc::MessageAttributes::removeAll (const std::string & *key*)

Removes all attributes with a certain key. This method removes all attributes that match a certain key.

Parameters:

- key* The key of the attributes to remove.

5.200.3.7 void Arc::MessageAttributes::set (const std::string & *key*, const std::string & *value*)

Sets a unique value of an attribute. This method removes any previous value of an attribute and sets the new value as the only value.

Parameters:

- key* The key of the attribute.
value The (new) value of the attribute.

5.200.4 Field Documentation**5.200.4.1 AttrMap Arc::MessageAttributes::attributes_ [protected]**

Internal storage of attributes. An AttrMap (multimap) in which all attributes (key-value pairs) are stored.

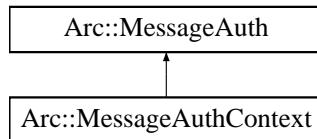

The documentation for this class was generated from the following file:

- MessageAttributes.h

5.201 Arc::MessageAuth Class Reference

Contains authencity information, authorization tokens and decisions.

#include <MessageAuth.h> Inheritance diagram for Arc::MessageAuth::

Public Member Functions

- void `set` (const std::string &key, `SecAttr` *value)
- void `remove` (const std::string &key)
- `SecAttr` * `get` (const std::string &key)
- `SecAttr` * `operator[]` (const std::string &key)
- bool `Export` (`SecAttrFormat` format, `XMLNode` &val) const
- `MessageAuth` * `Filter` (const std::list< std::string > &selected_keys, const std::list< std::string > &rejected_keys)

5.201.1 Detailed Description

Contains authencity information, authorization tokens and decisions. This class only supports string keys and `SecAttr` values.

5.201.2 Member Function Documentation

5.201.2.1 bool Arc::MessageAuth::`Export` (`SecAttrFormat` format, `XMLNode` & val) const

Returns properly catenated attributes in specified format. Content of XML node at is replaced with generated information if XML tree is empty. If tree at is not empty then `Export()` tries to merge generated information to already existing like everything would be generated inside same `Export()` method. If does not represent valid node then new XML tree is created.

5.201.2.2 `MessageAuth*` Arc::MessageAuth::`Filter` (const std::list< std::string > & selected_keys, const std::list< std::string > & rejected_keys)

Creates new instance of `MessageAuth` with attributes filtered. In new instance all attributes with keys listed in are removed. If is not empty only corresponding attributes are transferred to new instance. Created instance does not own refered attributes. Hence parent instance must not be deleted as long as this one is in use.

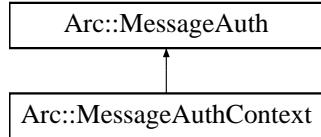

The documentation for this class was generated from the following file:

- `MessageAuth.h`

5.202 Arc::MessageAuthContext Class Reference

Handler for content of message auth* context.

```
#include <Message.h>
```

Inheritance diagram for Arc::MessageAuthContext::

5.202.1 Detailed Description

Handler for content of message auth* context. This class is a container for authorization and authentication information. It gets associated with [Message](#) object usually by first [MCC](#) in a chain and is kept as long as connection persists.

The documentation for this class was generated from the following file:

- [Message.h](#)

5.203 Arc::MessageContext Class Reference

Handler for content of message context.

```
#include <Message.h>
```

Public Member Functions

- void [Add](#) (const std::string &name, [MessageContextElement](#) *element)

5.203.1 Detailed Description

Handler for content of message context. This class is a container for objects derived from [MessageContextElement](#). It gets associated with [Message](#) object usually by first [MCC](#) in a chain and is kept as long as connection persists.

5.203.2 Member Function Documentation

5.203.2.1 void Arc::MessageContext::Add (const std::string & *name*, [MessageContextElement](#) * *element*)

Provided element is taken over by this class. It is remembered by it and destroyed when this class is destroyed.

The documentation for this class was generated from the following file:

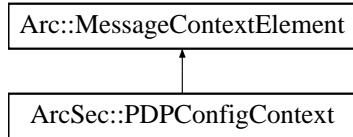

- Message.h

5.204 Arc::MessageContextElement Class Reference

Top class for elements contained in message context.

```
#include <Message.h>
```

Inheritance diagram for Arc::MessageContextElement::

5.204.1 Detailed Description

Top class for elements contained in message context. Objects of classes inherited with this one may be stored in [MessageContext](#) container.

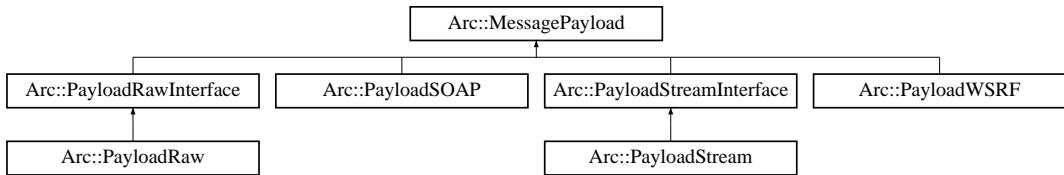

The documentation for this class was generated from the following file:

- [Message.h](#)

5.205 Arc::MessagePayload Class Reference

Base class for content of message passed through chain.

```
#include <Message.h>
```

Inheritance diagram for Arc::MessagePayload::

5.205.1 Detailed Description

Base class for content of message passed through chain. It's not intended to be used directly. Instead functional classes must be derived from it.

The documentation for this class was generated from the following file:

- Message.h

5.206 Arc::ModuleDesc Class Reference

Description of loadable module.

```
#include <Plugin.h>
```

5.206.1 Detailed Description

Description of loadable module. This class is used for reports

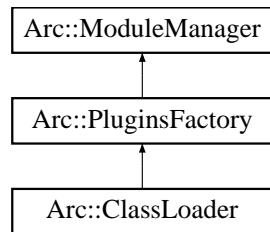

The documentation for this class was generated from the following file:

- `Plugin.h`

5.207 Arc::ModuleManager Class Reference

Manager of shared libraries.

```
#include <ModuleManager.h>
```

Public Member Functions

- [ModuleManager \(XMLNode cfg\)](#)
- [Glib::Module * load \(const std::string &name, bool probe\)](#)
- [std::string find \(const std::string &name\)](#)
- [Glib::Module * reload \(Glib::Module *module\)](#)
- [void use \(Glib::Module *module\)](#)
- [void unuse \(Glib::Module *module\)](#)
- [std::string findLocation \(const std::string &name\)](#)
- [bool makePersistent \(Glib::Module *module\)](#)
- [bool makePersistent \(const std::string &name\)](#)
- [void setCfg \(XMLNode cfg\)](#)

Protected Member Functions

- [void unload \(Glib::Module *module\)](#)
- [void unload \(const std::string &name\)](#)

5.207.1 Detailed Description

Manager of shared libraries. This class loads shared libraries/modules. There supposed to be created one instance of it per executable. In such circumstances it would cache handles to loaded modules and not load them multiple times.

5.207.2 Constructor & Destructor Documentation

5.207.2.1 Arc::ModuleManager::ModuleManager (XMLNode *cfg*)

Constructor. It is supposed to process correponding configuration subtree and tune module loading parameters accordingly.

5.207.3 Member Function Documentation

5.207.3.1 std::string Arc::ModuleManager::find (const std::string & name)

Finds loadable module by 'name' looking in same places as [load\(\)](#) does, but does not load it.

5.207.3.2 std::string Arc::ModuleManager::findLocation (const std::string & name)

Finds shared library corresponding to module 'name' and returns path to it

5.207.3.3 Glib::Module* Arc::ModuleManager::load (const std::string & name, bool probe)

Finds module 'name' in cache or loads corresponding loadable module

5.207.3.4 bool Arc::ModuleManager::makePersistent (const std::string & name)

Make sure this module is never unloaded. Even if [unload\(\)](#) is called.

5.207.3.5 bool Arc::ModuleManager::makePersistent (Glib::Module * module)

Make sure this module is never unloaded. Even if [unload\(\)](#) is called. Call to this method does not affect how other methods are behaving. Just loaded module stays in memory after all unloading procedures.

5.207.3.6 Glib::Module* Arc::ModuleManager::reload (Glib::Module * module)

Reload module previously loaded in probe mode. New module is loaded with all symbols resolved and old module handler is unloaded. In case of error old module is not unloaded.

5.207.3.7 void Arc::ModuleManager::setCfg (XMLNode cfg)

Input the configuration subtree, and trigger the module loading (do almost the same as the Constructor). This method is designed for [ClassLoader](#) to adopt the singleton pattern.

5.207.3.8 void Arc::ModuleManager::unload (const std::string & name) [protected]

Unload module by its name

5.207.3.9 void Arc::ModuleManager::unload (Glib::Module * module) [protected]

Unload module by its identifier. Decreases load counter and unloads module when it reaches 0.

5.207.3.10 void Arc::ModuleManager::unuse (Glib::Module * module)

Decrease usage count till it reaches 0. This call does not unload module. Usage counter is only for preventing unexpected unload. Unloading is done by [unload\(\)](#) methods and by destructor if usage counter is zero.

5.207.3.11 void Arc::ModuleManager::use (Glib::Module * *module*)

Increase usage count of loaded module. It is intended to be called by plugins or other code which needs prevent module to be unloaded while its code is running. Must be accompanied by `unuse` when module is not needed.

The documentation for this class was generated from the following file:

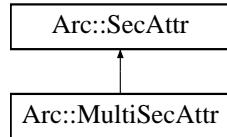

- `ModuleManager.h`

5.208 Arc::MultiSecAttr Class Reference

Container of multiple [SecAttr](#) attributes.

```
#include <SecAttr.h>
```

Inheritance diagram for Arc::MultiSecAttr::

Public Member Functions

- virtual [operator bool \(\) const](#)
- virtual [bool Export \(SecAttrFormat format, XMLNode &val\) const](#)

5.208.1 Detailed Description

Container of multiple [SecAttr](#) attributes. This class combines multiple attributes. It's export/import methods catenate results of underlying objects. Primary meaning of this class is to serve as base for classes implementing multi level hierarchical tree-like descriptions of user identity. It may also be used for collecting information of same source or kind. Like all information extracted from X509 certificate.

5.208.2 Member Function Documentation

5.208.2.1 virtual [bool Arc::MultiSecAttr::Export \(SecAttrFormat format, XMLNode & val\) const \[virtual\]](#)

Convert internal structure into specified format. Returns false if format is not supported/suitable for this attribute. XML node referenced by is turned into top level element of specified format.

Reimplemented from [Arc::SecAttr](#).

5.208.2.2 virtual [Arc::MultiSecAttr::operator bool \(\) const \[virtual\]](#)

This function should return false if the value is to be considered null, e.g. if it hasn't been set or initialized. In other cases it should return true.

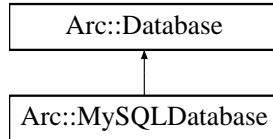

Reimplemented from [Arc::SecAttr](#).

The documentation for this class was generated from the following file:

- [SecAttr.h](#)

5.209 Arc::MySQLDatabase Class Reference

#include <MysqlWrapper.h> Inheritance diagram for Arc::MySQLDatabase:::

Public Member Functions

- virtual bool `connect` (std::string &dbname, std::string &user, std::string &password)
- virtual bool `isconnected` () const
- virtual void `close` ()
- virtual bool `enable_ssl` (const std::string &keyfile="", const std::string &certfile="", const std::string &cafile="", const std::string &capath "")
- virtual bool `shutdown` ()

5.209.1 Detailed Description

Implement the database accessing interface in `DBInterface.h` by using mysql client library for accessing mysql database

5.209.2 Member Function Documentation

5.209.2.1 virtual void Arc::MySQLDatabase::close () [virtual]

Close the connection with database server

Implements [Arc::Database](#).

5.209.2.2 virtual bool Arc::MySQLDatabase::connect (std::string & dbname, std::string & user, std::string & password) [virtual]

Do connection with database server

Parameters:

- `dbname` The database name which will be used.
- `user` The username which will be used to access database.
- `password` The password which will be used to access database.

Implements [Arc::Database](#).

5.209.2.3 virtual bool Arc::MySQLDatabase::enable_ssl (const std::string & keyfile = "", const std::string & certfile = "", const std::string & cafile = "", const std::string & capath = "") [virtual]

Enable ssl communication for the connection

Parameters:

- keyfile* The location of key file.
- certfile* The location of certificate file.
- cafile* The location of ca file.
- capath* The location of ca directory

Implements [Arc::Database](#).

5.209.2.4 virtual bool Arc::MySQLDatabase::isconnected () const [inline, virtual]

Get the connection status

Implements [Arc::Database](#).

5.209.2.5 virtual bool Arc::MySQLDatabase::shutdown () [virtual]

Ask database server to shutdown

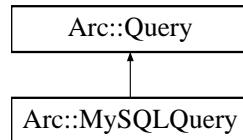

Implements [Arc::Database](#).

The documentation for this class was generated from the following file:

- MysqlWrapper.h

5.210 Arc::MySQLQuery Class Reference

Inheritance diagram for Arc::MySQLQuery::

Public Member Functions

- virtual int `get_num_columns()`
- virtual int `get_num_rows()`
- virtual bool `execute(const std::string &sqlstr)`
- virtual QueryRowResult `get_row(int row_number) const`
- virtual QueryRowResult `get_row() const`
- virtual std::string `get_row_field(int row_number, std::string &field_name)`
- virtual bool `get_array(std::string &sqlstr, QueryArrayResult &result, std::vector<std::string> &arguments)`

5.210.1 Member Function Documentation

5.210.1.1 virtual bool Arc::MySQLQuery::execute (const std::string & *sqlstr*) [virtual]

Execute the query

Parameters:

sqlstr The sql sentence used to query

Implements [Arc::Query](#).

5.210.1.2 virtual bool Arc::MySQLQuery::get_array (std::string & *sqlstr*, QueryArrayResult & *result*, std::vector<std::string> & *arguments*) [virtual]

Query the database by using some parameters into sql sentence e.g. "select table.value from table where table.name = ?"

Parameters:

sqlstr The sql sentence with some parameters marked with "?".

result The result in an array which includes all of the value in query result.

arguments The argument list which should exactly correspond with the parameters in sql sentence.

Implements [Arc::Query](#).

5.210.1.3 virtual int Arc::MySQLQuery::get_num_columns () [virtual]

Get the column number in the query result

Implements [Arc::Query](#).

5.210.1.4 virtual int Arc::MySQLQuery::get_num_rows () [virtual]

Get the row number in the query result

Implements [Arc::Query](#).

5.210.1.5 virtual QueryRowResult Arc::MySQLQuery::get_row () const [virtual]

Get the value of one row in the query result, the row number will be automatically increased each time the method is called

Implements [Arc::Query](#).

5.210.1.6 virtual QueryRowResult Arc::MySQLQuery::get_row (int *row_number*) const [virtual]

Get the value of one row in the query result

Parameters:

row_number The number of the row

Returns:

A vector includes all the values in the row

Implements [Arc::Query](#).

5.210.1.7 virtual std::string Arc::MySQLQuery::get_row_field (int *row_number*, std::string & *field_name*) [virtual]

Get the value of one specific field in one specific row

Parameters:

row_number The row number inside the query result

field_name The field name for the value which will be return

Returns:

The value of the specified filed in the specified row

Implements [Arc::Query](#).

The documentation for this class was generated from the following file:

- MysqlWrapper.h

5.211 Arc::NotificationType Class Reference

The documentation for this class was generated from the following file:

5.213 Arc::OAuthConsumer Class Reference

#include <OAuthConsumer.h> Inheritance diagram for Arc::OAuthConsumer:::

Public Member Functions

- [OAuthConsumer](#) (const [MCCConfig](#) *cfg*, const [URL](#) *url*, std::list< std::string > *idp_stack*)
- [MCC_Status parseDN](#) (std::string **dn*)
- [MCC_Status approveCSR](#) (const std::string *approve_page*)
- [MCC_Status pushCSR](#) (const std::string *b64_pub_key*, const std::string *pub_key_hash*, std::string **approve_page*)
- [MCC_Status storeCert](#) (const std::string *cert_path*, const std::string *auth_token*, const std::string *b64_dn*)

Protected Member Functions

- [MCC_Status processLogin](#) (const std::string *username*= "", const std::string *password*= "")

5.213.1 Detailed Description

The OAuth functionality depends on the availability of the liboauth C-bindings library

5.213.2 Constructor & Destructor Documentation

5.213.2.1 [Arc::OAuthConsumer::OAuthConsumer](#) (const [MCCConfig](#) *cfg*, const [URL](#) *url*, std::list< std::string > *idp_stack*)

Construct an OAuth consumer with url as service provider. idp_name is currently ignored, since the idp to which the SAML2 redirect will take place is presently a hardcoded value on the SAML2 SP side. This is expected to change in the future.

5.213.3 Member Function Documentation

5.213.3.1 [MCC_Status Arc::OAuthConsumer::approveCSR](#) (const std::string *approve_page*) [virtual]

Unsupported placeholder function until Confusa supports OAuth.

Implements [Arc::SAML2LoginClient](#).

5.213.3.2 MCC_Status Arc::OAuthConsumer::parseDN (std::string * dn) [virtual]

Unsupported placeholder function until Confusa supports OAuth.

Implements [Arc::SAML2LoginClient](#).

5.213.3.3 MCC_Status Arc::OAuthConsumer::processLogin (const std::string username = "", const std::string password = "") [protected, virtual]

Main function performing all the OAuth login steps. Username and password will be ignored.

Implements [Arc::SAML2LoginClient](#).

5.213.3.4 MCC_Status Arc::OAuthConsumer::pushCSR (const std::string b64_pub_key, const std::string pub_key_hash, std::string * approve_page) [virtual]

Unsupported placeholder function until Confusa supports OAuth.

Implements [Arc::SAML2LoginClient](#).

5.213.3.5 MCC_Status Arc::OAuthConsumer::storeCert (const std::string cert_path, const std::string auth_token, const std::string b64_dn) [virtual]

Unsupported placeholder function until Confusa supports OAuth.

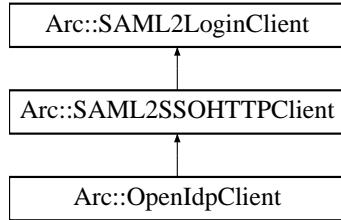

Implements [Arc::SAML2LoginClient](#).

The documentation for this class was generated from the following file:

- OAuthConsumer.h

5.214 Arc::OpenIdpClient Class Reference

Inheritance diagram for Arc::OpenIdpClient:::

Protected Member Functions

- [MCC_Status processIdPLogin \(const std::string username, const std::string password\)](#)
- [MCC_Status processConsent \(\)](#)
- [MCC_Status processIdP2Confusa \(\)](#)

5.214.1 Member Function Documentation

5.214.1.1 MCC_Status Arc::OpenIdpClient::processConsent () [protected, virtual]

If the IdP has a consent module and the user has not saved her consent, this method will ask the user for consent to transmission of her data to Confusa

Implements [Arc::SAML2SSOHTTPClient](#).

5.214.1.2 MCC_Status Arc::OpenIdpClient::processIdP2Confusa () [protected, virtual]

Redirects the user back from identity provider to the Confusa SP

Implements [Arc::SAML2SSOHTTPClient](#).

5.214.1.3 MCC_Status Arc::OpenIdpClient::processIdPLogin (const std::string *username*, const std::string *password*) [protected, virtual]

Actual identity provider parsers for next three methods implemented in subdirectory idp/

Parse identity provider login page and submit username and password in the previsioned way

Implements [Arc::SAML2SSOHTTPClient](#).

The documentation for this class was generated from the following file:

- OpenIdpClient.h

5.221 Arc::PathIterator Class Reference

Class to iterate through elements of path.

```
#include <URL.h>
```

Public Member Functions

- `PathIterator` (const std::string &path, bool end=false)
- `PathIterator & operator++ ()`
- `PathIterator & operator-- ()`
- `operator bool () const`
- `std::string operator* () const`
- `std::string Rest () const`

5.221.1 Detailed Description

Class to iterate through elements of path.

5.221.2 Constructor & Destructor Documentation

5.221.2.1 `Arc::PathIterator::PathIterator (const std::string & path, bool end = false)`

Constructor accepts path and stores it internally. If end is set to false iterator is pointing at first element in path. Otherwise selected element is one before last.

5.221.3 Member Function Documentation

5.221.3.1 `Arc::PathIterator::operator bool () const`

Return false when iterator moved outside path elements

5.221.3.2 `std::string Arc::PathIterator::operator* () const`

Returns part of initial path from first till and including current

5.221.3.3 `PathIterator& Arc::PathIterator::operator++ ()`

Advances iterator to point at next path element

5.221.3.4 `PathIterator& Arc::PathIterator::operator-- ()`

Moves iterator to element before current

5.221.3.5 std::string Arc::PathIterator::Rest () const

Returns part of initial path from one after current till end

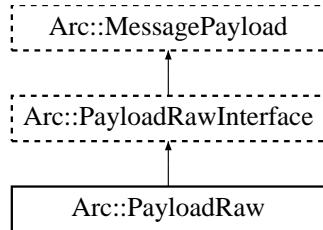

The documentation for this class was generated from the following file:

- URL.h

5.222 Arc::PayloadRaw Class Reference

Raw byte multi-buffer.

```
#include <PayloadRaw.h>Inheritance diagram for Arc::PayloadRaw::
```

Public Member Functions

- [PayloadRaw \(void\)](#)
- virtual [~PayloadRaw \(void\)](#)
- virtual char [operator\[\] \(Size_t pos\) const](#)
- virtual char * [Content \(Size_t pos=-1\)](#)
- virtual Size_t [Size \(void\) const](#)
- virtual char * [Insert \(Size_t pos=0, Size_t size=0\)](#)
- virtual char * [Insert \(const char *s, Size_t pos=0, Size_t size=-1\)](#)
- virtual char * [Buffer \(unsigned int num=0\)](#)
- virtual Size_t [BufferSize \(unsigned int num=0\) const](#)
- virtual Size_t [BufferPos \(unsigned int num=0\) const](#)
- virtual bool [Truncate \(Size_t size\)](#)

5.222.1 Detailed Description

Raw byte multi-buffer. This is implementation of [PayloadRawInterface](#). Buffers are memory blocks logically placed one after another.

5.222.2 Constructor & Destructor Documentation

5.222.2.1 Arc::PayloadRaw::PayloadRaw (void) [inline]

List of handled buffers. Constructor. Created object contains no buffers.

5.222.2.2 virtual Arc::PayloadRaw::~PayloadRaw (void) [virtual]

Destructor. Frees allocated buffers.

5.222.3 Member Function Documentation

5.222.3.1 virtual char* Arc::PayloadRaw::Buffer (unsigned int num = 0) [virtual]

Returns pointer to num'th buffer

Implements [Arc::PayloadRawInterface](#).

5.222.3.2 virtual **Size_t** Arc::PayloadRaw::BufferPos (**unsigned int num = 0**) const [virtual]

Returns position of num'th buffer

Implements [Arc::PayloadRawInterface](#).

5.222.3.3 virtual **Size_t** Arc::PayloadRaw::BufferSize (**unsigned int num = 0**) const [virtual]

Returns length of num'th buffer

Implements [Arc::PayloadRawInterface](#).

5.222.3.4 virtual **char*** Arc::PayloadRaw::Content (**Size_t pos = -1**) [virtual]

Get pointer to buffer content at global position 'pos'. By default to beginning of main buffer whatever that means.

Implements [Arc::PayloadRawInterface](#).

5.222.3.5 virtual **char*** Arc::PayloadRaw::Insert (**const char * s, Size_t pos = 0, Size_t size = -1**) [virtual]

Create new buffer at global position 'pos' of size 'size'. Created buffer is filled with content of memory at 's'. If 'size' is negative content at 's' is expected to be null-terminated.

Implements [Arc::PayloadRawInterface](#).

5.222.3.6 virtual **char*** Arc::PayloadRaw::Insert (**Size_t pos = 0, Size_t size = 0**) [virtual]

Create new buffer at global position 'pos' of size 'size'.

Implements [Arc::PayloadRawInterface](#).

5.222.3.7 virtual **char** Arc::PayloadRaw::operator[] (**Size_t pos**) const [virtual]

Returns content of byte at specified position. Specified position 'pos' is treated as global one and goes through all buffers placed one after another.

Implements [Arc::PayloadRawInterface](#).

5.222.3.8 virtual **Size_t** Arc::PayloadRaw::Size (**void**) const [virtual]

Returns logical size of whole structure.

Implements [Arc::PayloadRawInterface](#).

5.222.3.9 virtual **bool** Arc::PayloadRaw::Truncate (**Size_t size**) [virtual]

Change size of stored information. If size exceeds end of allocated buffer, buffers are not re-allocated, only logical size is extended. Buffers with location behind new size are deallocated.

Implements [Arc::PayloadRawInterface](#).

The documentation for this class was generated from the following file:

- PayloadRaw.h

5.223 Arc::PayloadRawBuf Struct Reference

Data Fields

- int [size](#)
- int [length](#)
- bool [allocated](#)

5.223.1 Field Documentation

5.223.1.1 bool Arc::PayloadRawBuf::allocated

size of used memory - size of buffer

5.223.1.2 int Arc::PayloadRawBuf::length

size of allocated memory

5.223.1.3 int Arc::PayloadRawBuf::size

pointer to buffer in memory

The documentation for this struct was generated from the following file:

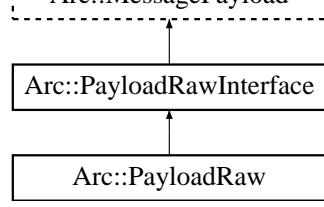

- [PayloadRaw.h](#)

5.224 Arc::PayloadRawInterface Class Reference

Random Access Payload for [Message](#) objects.

```
#include <PayloadRaw.h>
```

Inheritance diagram for Arc::PayloadRawInterface:::

Public Member Functions

- virtual char [operator\[\]](#) (Size_t pos) const =0
- virtual char * [Content](#) (Size_t pos=-1)=0
- virtual Size_t [Size](#) (void) const =0
- virtual char * [Insert](#) (Size_t pos=0, Size_t size=0)=0
- virtual char * [Insert](#) (const char *s, Size_t pos=0, Size_t size=-1)=0
- virtual char * [Buffer](#) (unsigned int num)=0
- virtual Size_t [BufferSize](#) (unsigned int num) const =0
- virtual Size_t [BufferPos](#) (unsigned int num) const =0
- virtual bool [Truncate](#) (Size_t size)=0

5.224.1 Detailed Description

Random Access Payload for [Message](#) objects. This class is a virtual interface for managing [Message](#) payload with arbitrarily accessible content. Inheriting classes are supposed to implement memory-resident or memory-mapped content made of optionally multiple chunks/buffers. Every buffer has own size and offset. This class is purely virtual.

5.224.2 Member Function Documentation

5.224.2.1 virtual char* Arc::PayloadRawInterface::Buffer (unsigned int num) [pure virtual]

Returns pointer to num'th buffer

Implemented in [Arc::PayloadRaw](#).

5.224.2.2 virtual Size_t Arc::PayloadRawInterface::BufferPos (unsigned int num) const [pure virtual]

Returns position of num'th buffer

Implemented in [Arc::PayloadRaw](#).

5.224.2.3 virtual Size_t Arc::PayloadRawInterface::BufferSize (unsigned int num) const [pure virtual]

Returns length of num'th buffer

Implemented in [Arc::PayloadRaw](#).

5.224.2.4 virtual char* Arc::PayloadRawInterface::Content (Size_t pos = -1) [pure virtual]

Get pointer to buffer content at global position 'pos'. By default to beginning of main buffer whatever that means.

Implemented in [Arc::PayloadRaw](#).

5.224.2.5 virtual char* Arc::PayloadRawInterface::Insert (const char * s, Size_t pos = 0, Size_t size = -1) [pure virtual]

Create new buffer at global position 'pos' of size 'size'. Created buffer is filled with content of memory at 's'. If 'size' is negative content at 's' is expected to be null-terminated.

Implemented in [Arc::PayloadRaw](#).

5.224.2.6 virtual char* Arc::PayloadRawInterface::Insert (Size_t pos = 0, Size_t size = 0) [pure virtual]

Create new buffer at global position 'pos' of size 'size'.

Implemented in [Arc::PayloadRaw](#).

5.224.2.7 virtual char Arc::PayloadRawInterface::operator[] (Size_t pos) const [pure virtual]

Returns content of byte at specified position. Specified position 'pos' is treated as global one and goes through all buffers placed one after another.

Implemented in [Arc::PayloadRaw](#).

5.224.2.8 virtual Size_t Arc::PayloadRawInterface::Size (void) const [pure virtual]

Returns logical size of whole structure.

Implemented in [Arc::PayloadRaw](#).

5.224.2.9 virtual bool Arc::PayloadRawInterface::Truncate (Size_t size) [pure virtual]

Change size of stored information. If size exceeds end of allocated buffer, buffers are not re-allocated, only logical size is extended. Buffers with location behind new size are deallocated.

Implemented in [Arc::PayloadRaw](#).

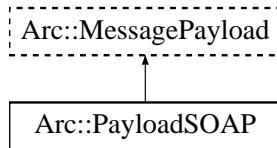

The documentation for this class was generated from the following file:

- PayloadRaw.h

5.225 Arc::PayloadSOAP Class Reference

Payload of [Message](#) with SOAP content.

```
#include <PayloadSOAP.h>Inheritance diagram for Arc::PayloadSOAP::
```

Public Member Functions

- [PayloadSOAP \(const NS &ns, bool fault=false\)](#)
- [PayloadSOAP \(const SOAPEnvelope &soap\)](#)
- [PayloadSOAP \(const MessagePayload &source\)](#)

5.225.1 Detailed Description

Payload of [Message](#) with SOAP content. This class combines [MessagePayload](#) with [SOAPEnvelope](#) to make it possible to pass SOAP messages through [MCC](#) chain.

5.225.2 Constructor & Destructor Documentation

5.225.2.1 Arc::PayloadSOAP::PayloadSOAP (const NS & ns, bool *fault = false*)

Constructor - creates new [Message](#) payload

5.225.2.2 Arc::PayloadSOAP::PayloadSOAP (const SOAPEnvelope & soap)

Constructor - creates [Message](#) payload from SOAP document. Provided SOAP document is copied to new object.

5.225.2.3 Arc::PayloadSOAP::PayloadSOAP (const MessagePayload & source)

Constructor - creates SOAP message from payload. [PayloadRawInterface](#) and derived classes are supported.

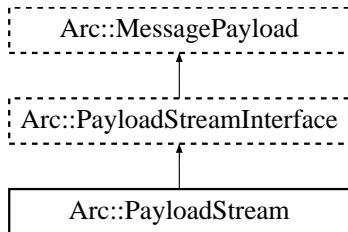

The documentation for this class was generated from the following file:

- [PayloadSOAP.h](#)

5.226 Arc::PayloadStream Class Reference

POSIX handle as Payload.

```
#include <PayloadStream.h>Inheritance diagram for Arc::PayloadStream::
```

Public Member Functions

- [PayloadStream \(int h=-1\)](#)
- virtual [~PayloadStream \(void\)](#)
- virtual bool [Get \(char *buf, int &size\)](#)
- virtual bool [Get \(std::string &buf\)](#)
- virtual std::string [Get \(void\)](#)
- virtual bool [Put \(const char *buf, Size_t size\)](#)
- virtual bool [Put \(const std::string &buf\)](#)
- virtual bool [Put \(const char *buf\)](#)
- virtual [operator bool \(void\)](#)
- virtual [operator! \(void\)](#)
- virtual int [Timeout \(void\) const](#)
- virtual void [Timeout \(int to\)](#)
- virtual [Size_t Pos \(void\) const](#)
- virtual [Size_t Size \(void\) const](#)
- virtual [Size_t Limit \(void\) const](#)

Protected Attributes

- int [handle_](#)
- bool [seekable_](#)

5.226.1 Detailed Description

POSIX handle as Payload. This is an implementation of [PayloadStreamInterface](#) for generic POSIX handle.

5.226.2 Constructor & Destructor Documentation

5.226.2.1 Arc::PayloadStream::PayloadStream (int *h* = -1)

true if lseek operation is applicable to open handle Constructor. Attaches to already open handle. Handle is not managed by this class and must be closed by external code.

5.226.2.2 virtual Arc::PayloadStream::~PayloadStream (void) [inline, virtual]

Destructor.

5.226.3 Member Function Documentation**5.226.3.1 virtual std::string Arc::PayloadStream::Get (void) [inline, virtual]**

Read as many as possible (sane amount) of bytes.

Implements [Arc::PayloadStreamInterface](#).

References Get().

Referenced by Get().

5.226.3.2 virtual bool Arc::PayloadStream::Get (std::string & buf) [virtual]

Read as many as possible (sane amount) of bytes into buf.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.3 virtual bool Arc::PayloadStream::Get (char * buf, int & size) [virtual]

Extracts information from stream up to 'size' bytes. 'size' contains number of read bytes on exit. Returns true in case of success.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.4 virtual Size_t Arc::PayloadStream::Limit (void) const [inline, virtual]

Returns position at which stream reading will stop if supported. That may be not same as [Size\(\)](#) if instance is meant to provide access to only part of underlying obejct.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.5 virtual Arc::PayloadStream::operator bool (void) [inline, virtual]

Returns true if stream is valid.

Implements [Arc::PayloadStreamInterface](#).

References handle_.

5.226.3.6 virtual bool Arc::PayloadStream::operator! (void) [inline, virtual]

Returns true if stream is invalid.

Implements [Arc::PayloadStreamInterface](#).

References handle_.

5.226.3.7 virtual Size_t Arc::PayloadStream::Pos (void) const [inline, virtual]

Returns current position in stream if supported.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.8 virtual bool Arc::PayloadStream::Put (const char * buf) [inline, virtual]

Push null terminated information from 'buf' into stream. Returns true on success.

Implements [Arc::PayloadStreamInterface](#).

References Put().

Referenced by Put().

5.226.3.9 virtual bool Arc::PayloadStream::Put (const std::string & buf) [inline, virtual]

Push information from 'buf' into stream. Returns true on success.

Implements [Arc::PayloadStreamInterface](#).

References Put().

Referenced by Put().

5.226.3.10 virtual bool Arc::PayloadStream::Put (const char * buf, Size_t size) [virtual]

Push 'size' bytes from 'buf' into stream. Returns true on success.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.11 virtual Size_t Arc::PayloadStream::Size (void) const [inline, virtual]

Returns size of underlying object if supported.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.12 virtual void Arc::PayloadStream::Timeout (int to) [inline, virtual]

Set current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implements [Arc::PayloadStreamInterface](#).

5.226.3.13 virtual int Arc::PayloadStream::Timeout (void) const [inline, virtual]

Query current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implements [Arc::PayloadStreamInterface](#).

5.226.4 Field Documentation

5.226.4.1 int Arc::PayloadStream::handle_ [protected]

Timeout for read/write operations

Referenced by operator bool(), and operator!().

5.226.4.2 bool Arc::PayloadStream::seekable_ [protected]

Handle for operations

The documentation for this class was generated from the following file:

5.227.1 Detailed Description

Stream-like Payload for [Message](#) object. This class is a virtual interface for managing stream-like source and destination. It's supposed to be passed through [MCC](#) chain as payload of [Message](#). It must be treated by MCCs and Services as dynamic payload. This class is purely virtual.

5.227.2 Member Function Documentation

5.227.2.1 virtual std::string Arc::PayloadStreamInterface::Get (void) [pure virtual]

Read as many as possible (sane amount) of bytes.

Implemented in [Arc::PayloadStream](#).

5.227.2.2 virtual bool Arc::PayloadStreamInterface::Get (std::string & buf) [pure virtual]

Read as many as possible (sane amount) of bytes into buf.

Implemented in [Arc::PayloadStream](#).

5.227.2.3 virtual bool Arc::PayloadStreamInterface::Get (char * buf, int & size) [pure virtual]

Extracts information from stream up to 'size' bytes. 'size' contains number of read bytes on exit. Returns true in case of success.

Implemented in [Arc::PayloadStream](#).

5.227.2.4 virtual Size_t Arc::PayloadStreamInterface::Limit (void) const [pure virtual]

Returns position at which stream reading will stop if supported. That may be not same as [Size\(\)](#) if instance is meant to provide access to only part of underlying object.

Implemented in [Arc::PayloadStream](#).

5.227.2.5 virtual Arc::PayloadStreamInterface::operator bool (void) [pure virtual]

Returns true if stream is valid.

Implemented in [Arc::PayloadStream](#).

5.227.2.6 virtual bool Arc::PayloadStreamInterface::operator! (void) [pure virtual]

Returns true if stream is invalid.

Implemented in [Arc::PayloadStream](#).

5.227.2.7 virtual Size_t Arc::PayloadStreamInterface::Pos (void) const [pure virtual]

Returns current position in stream if supported.

Implemented in [Arc::PayloadStream](#).

5.227.2.8 virtual bool Arc::PayloadStreamInterface::Put (const char * buf) [pure virtual]

Push null terminated information from 'buf' into stream. Returns true on success.

Implemented in [Arc::PayloadStream](#).

5.227.2.9 virtual bool Arc::PayloadStreamInterface::Put (const std::string & buf) [pure virtual]

Push information from 'buf' into stream. Returns true on success.

Implemented in [Arc::PayloadStream](#).

5.227.2.10 virtual bool Arc::PayloadStreamInterface::Put (const char * buf, Size_t size) [pure virtual]

Push 'size' bytes from 'buf' into stream. Returns true on success.

Implemented in [Arc::PayloadStream](#).

5.227.2.11 virtual Size_t Arc::PayloadStreamInterface::Size (void) const [pure virtual]

Returns size of underlying object if supported.

Implemented in [Arc::PayloadStream](#).

5.227.2.12 virtual void Arc::PayloadStreamInterface::Timeout (int *to*) [pure virtual]

Set current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implemented in [Arc::PayloadStream](#).

5.227.2.13 virtual int Arc::PayloadStreamInterface::Timeout (void) const [pure virtual]

Query current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implemented in [Arc::PayloadStream](#).

The documentation for this class was generated from the following file:

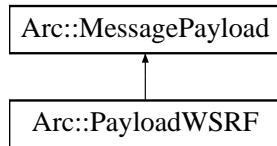

- [PayloadStream.h](#)

5.228 Arc::PayloadWSRF Class Reference

This class combines [MessagePayload](#) with [WSRF](#).

```
#include <PayloadWSRF.h>
```

Inheritance diagram for Arc::PayloadWSRF::

Public Member Functions

- [PayloadWSRF \(const SOAPEnvelope &soap\)](#)
- [PayloadWSRF \(WSRF &wsrp\)](#)
- [PayloadWSRF \(const MessagePayload &source\)](#)

5.228.1 Detailed Description

This class combines [MessagePayload](#) with [WSRF](#). Its intention is to make it possible to pass [WSRF](#) messages through [MCC](#) chain as one more Payload type.

5.228.2 Constructor & Destructor Documentation

5.228.2.1 Arc::PayloadWSRF::PayloadWSRF (const SOAPEnvelope & soap)

Constructor - creates [Message](#) payload from SOAP message. Returns invalid [WSRF](#) if SOAP does not represent WS-ResourceProperties

5.228.2.2 Arc::PayloadWSRF::PayloadWSRF (WSRF & wsrp)

Constructor - creates [Message](#) payload with acquired [WSRF](#) message. [WSRF](#) message will be destroyed by destructor of this object.

5.228.2.3 Arc::PayloadWSRF::PayloadWSRF (const MessagePayload & source)

Constructor - creates [WSRF](#) message from payload. All classes derived from SOAPEnvelope are supported.

The documentation for this class was generated from the following file:

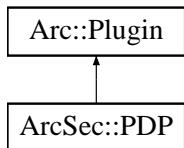

- [PayloadWSRF.h](#)

5.229 ArcSec::PDP Class Reference

Base class for [Policy](#) Decision Point plugins.

```
#include <PDP.h>
```

Inheritance diagram for ArcSec::PDP::

5.229.1 Detailed Description

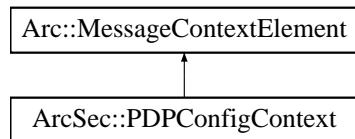

Base class for [Policy](#) Decision Point plugins. This virtual class defines method `isPermitted()` which processes security related information/attributes in `Message` and makes security decision - permit (true) or deny (false). Configuration of [PDP](#) is consumed during creation of instance through XML subtree fed to constructor.

The documentation for this class was generated from the following file:

- `PDP.h`

5.230 ArcSec::PDPConfigContext Class Reference

Inheritance diagram for ArcSec::PDPConfigContext::

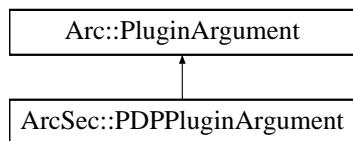

The documentation for this class was generated from the following file:

- PDP.h

- `bool operator<= (const Period &) const`
- `bool operator>= (const Period &) const`
- `bool operator== (const Period &) const`
- `bool operator!= (const Period &) const`

5.232.1 Constructor & Destructor Documentation

5.232.1.1 Arc::Period::Period ()

Default constructor. The period is set to 0 length.

5.232.1.2 Arc::Period::Period (time_t)

Constructor that takes a time_t variable and stores it.

5.232.1.3 Arc::Period::Period (time_t *seconds*, uint32_t *nanoseconds*)

Constructor that takes seconds and nanoseconds and stores them.

5.232.1.4 Arc::Period::Period (const std::string &, PeriodBase *base* = PeriodSeconds)

Constructor that tries to convert a string.

5.232.2 Member Function Documentation

5.232.2.1 time_t Arc::Period::GetPeriod () const

gets the period

5.232.2.2 const sigc::slot<const char*>* Arc::Period::istr () const

For use with [IString](#)

5.232.2.3 Arc::Period::operator std::string () const

Returns a string representation of the period.

5.232.2.4 bool Arc::Period::operator!= (const Period &) const

Comparing two [Period](#) objects.

5.232.2.5 bool Arc::Period::operator< (const Period &) const

Comparing two [Period](#) objects.

5.232.2.6 bool Arc::Period::operator<= (const Period &) const

Comparing two [Period](#) objects.

5.232.2.7 Period& Arc::Period::operator= (const Period &)

Assignment operator from a [Period](#).

5.232.2.8 Period& Arc::Period::operator= (time_t)

Assignment operator from a time_t.

5.232.2.9 bool Arc::Period::operator== (const Period &) const

Comparing two [Period](#) objects.

5.232.2.10 bool Arc::Period::operator> (const Period &) const

Comparing two [Period](#) objects.

5.232.2.11 bool Arc::Period::operator>= (const Period &) const

Comparing two [Period](#) objects.

5.232.2.12 void Arc::Period::SetPeriod (time_t)

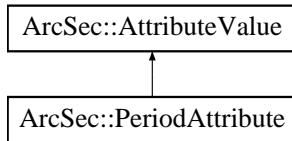

sets the period

The documentation for this class was generated from the following file:

- [DateTime.h](#)

5.233 ArcSec::PeriodAttribute Class Reference

5.233.1 Detailed Description

Format: datetime"/duration datetime"/datetime duration"/datetime

5.233.2 Member Function Documentation

5.233.2.1 virtual std::string ArcSec::PeriodAttribute::encode() [virtual]

encode the value in a string format

Implements [ArcSec::AttributeValue](#).

5.233.2.2 virtual std::string ArcSec::PeriodAttribute::getId() [inline, virtual]

Get the AttributeId of the <Attribute>

Implements [ArcSec::AttributeValue](#).

5.233.2.3 virtual std::string ArcSec::PeriodAttribute::getType() [inline, virtual]

Get the DataType of the <Attribute>

Implements [ArcSec::AttributeValue](#).

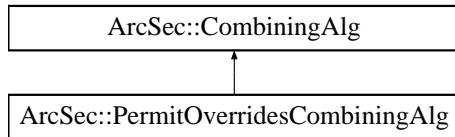

The documentation for this class was generated from the following file:

- [DateTimeAttribute.h](#)

5.234 ArcSec::PermitOverridesCombiningAlg Class Reference

Implement the "Permit-Overrides" algorithm.

```
#include <PermitOverridesAlg.h>Inheritance diagram for Arc-  
Sec::PermitOverridesCombiningAlg::
```

Public Member Functions

- virtual Result [combine \(EvaluationCtx *ctx, std::list< Policy * > policies\)](#)
- virtual const std::string & [getalgId \(void\) const](#)

5.234.1 Detailed Description

Implement the "Permit-Overrides" algorithm. Permit-Overrides, scans the policy set which is given as the parameters of "combine" method, if gets "permit" result from any policy, then stops scanning and gives "permit" as result, otherwise gives "deny".

5.234.2 Member Function Documentation

5.234.2.1 virtual Result ArcSec::PermitOverridesCombiningAlg::combine (EvaluationCtx * *ctx*, std::list< Policy * > *policies*) [virtual]

If there is one policy which return positive evaluation result, then omit the other policies and return DECISION_PERMIT

Parameters:

ctx This object contains request information which will be used to evaluated against policy.

policies This is a container which contains policy objects.

Returns:

The combined result according to the algorithm.

Implements [ArcSec::CombiningAlg](#).

5.234.2.2 virtual const std::string& ArcSec::PermitOverridesCombiningAlg::getalgId (void) const [inline, virtual]

Get the identifier

Implements [ArcSec::CombiningAlg](#).

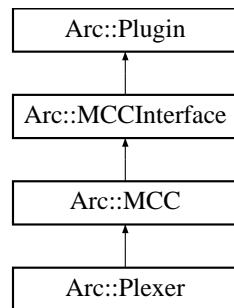

The documentation for this class was generated from the following file:

- PermitOverridesAlg.h

5.235 Arc::Plexer Class Reference

The [Plexer](#) class, used for routing messages to services.

#include <Plexer.h> Inheritance diagram for Arc::Plexer:::

Public Member Functions

- [Plexer \(Config *cfg, PluginArgument *arg\)](#)
- virtual [~Plexer \(\)](#)
- virtual void [Next \(MCCInterface *next, const std::string &label\)](#)
- virtual [MCC_Status process \(Message &request, Message &response\)](#)

Static Public Attributes

- static [Logger logger](#)

5.235.1 Detailed Description

The [Plexer](#) class, used for routing messages to services. This is the [Plexer](#) class. Its purpose is to route incoming messages to appropriate Services and [MCC](#) chains.

5.235.2 Constructor & Destructor Documentation

5.235.2.1 Arc::Plexer::Plexer (Config * *cfg*, PluginArgument * *arg*)

The constructor. This is the constructor. Since all member variables are instances of "well-behaving" STL classes, nothing needs to be done.

5.235.2.2 virtual Arc::Plexer::~Plexer () [virtual]

The destructor. This is the destructor. Since all member variables are instances of "well-behaving" STL classes, nothing needs to be done.

5.235.3 Member Function Documentation

5.235.3.1 **virtual void Arc::Plexer::Next (MCCInterface * *next*, const std::string & *label*) [virtual]**

Add reference to next [MCC](#) in chain. This method is called by [Loader](#) for every potentially labeled link to next component which implements [MCCInterface](#). If next is set NULL corresponding link is removed.

Reimplemented from [Arc::MCC](#).

5.235.3.2 **virtual MCC_Status Arc::Plexer::process (Message & *request*, Message & *response*) [virtual]**

Route request messages to appropriate services. Routes the request message to the appropriate service. Routing is based on the path part of value of the ENDPOINT attribute. Routed message is assigned following attributes: PLEXER:PATTERN - matched pattern, PLEXER:EXTENSION - last unmatched part of ENDPOINT path.

Reimplemented from [Arc::MCC](#).

5.235.4 Field Documentation

5.235.4.1 **Logger Arc::Plexer::logger [static]**

A logger for MCCs. A logger intended to be the parent of loggers in the different MCCs.

Reimplemented from [Arc::MCC](#).

The documentation for this class was generated from the following file:

- [Plexer.h](#)

5.236 Arc::PlexerEntry Class Reference

A pair of label (regex) and pointer to [MCC](#).

```
#include <Plexer.h>
```

5.236.1 Detailed Description

A pair of label (regex) and pointer to [MCC](#). A helper class that stores a label (regex) and a pointer to a service.

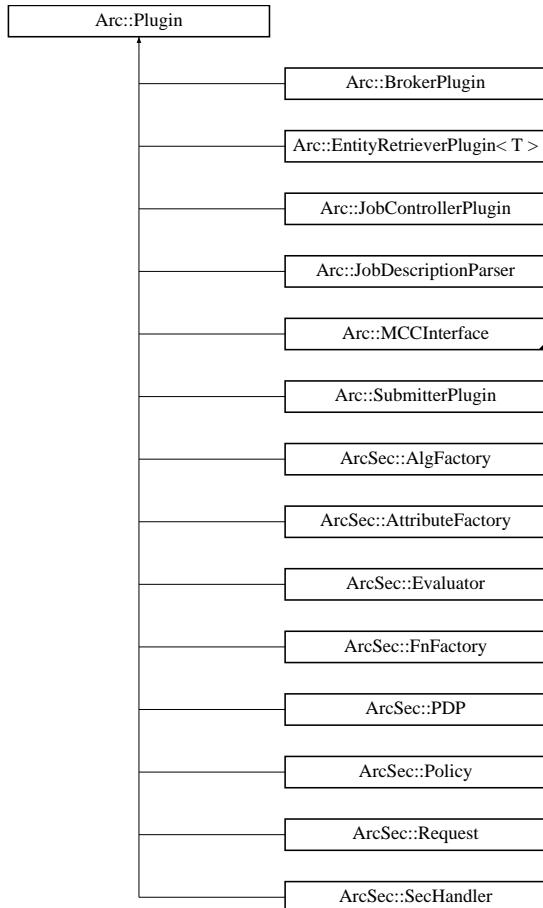

The documentation for this class was generated from the following file:

- [Plexer.h](#)

5.237 Arc::Plugin Class Reference

Base class for loadable ARC components.

#include <Plugin.h> Inheritance diagram for Arc::Plugin::

Protected Member Functions

- [Plugin \(PluginArgument *arg\)](#)
- [Plugin \(const Plugin &obj\)](#)

5.237.1 Detailed Description

Base class for loadable ARC components. All classes representing loadable ARC components must be either descendants of this class or be wrapped by its offspring.

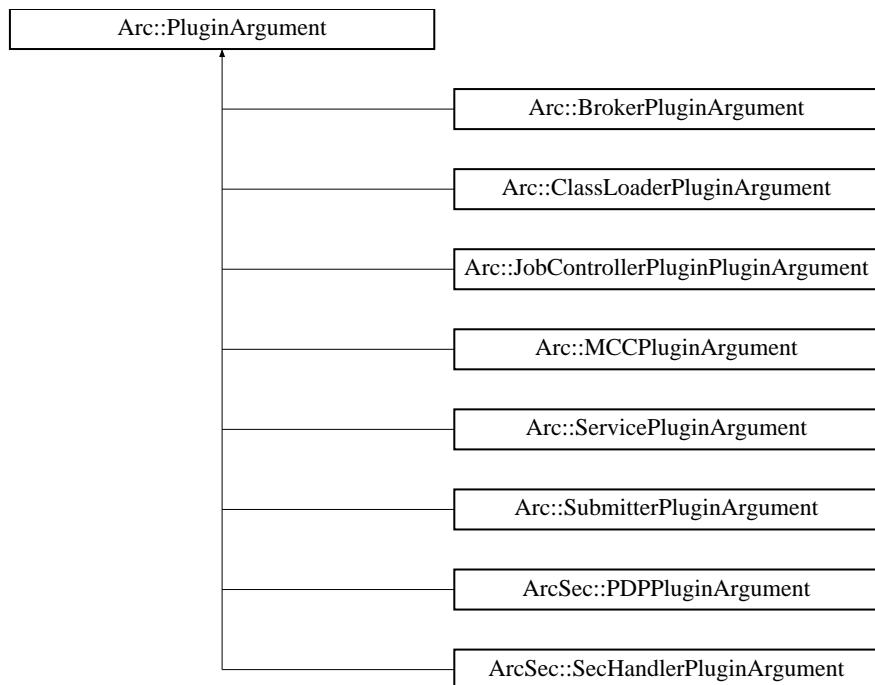

The documentation for this class was generated from the following file:

- [Plugin.h](#)

5.238 Arc::PluginArgument Class Reference

Base class for passing arguments to loadable ARC components.

```
#include <Plugin.h>
```

Public Member Functions

- [PluginsFactory * get_factory \(void\)](#)
- [Glib::Module * get_module \(void\)](#)

5.238.1 Detailed Description

Base class for passing arguments to loadable ARC components. During its creation constructor function of ARC loadable component expects instance of class inherited from this one or wrapped in it. Then dynamic type casting is used for obtaining class of expected kind.

5.238.2 Member Function Documentation

5.238.2.1 PluginsFactory* Arc::PluginArgument::get_factory (void)

Returns pointer to factory which instantiated plugin. Because factory usually destroys/unloads plugins in its destructor it should be safe to keep this pointer inside plugin for later use. But one must always check.

5.238.2.2 **Glib::Module* Arc::PluginArgument::get_module (void)**

Returns pointer to loadable module/library which contains plugin. Corresponding factory keeps list of modules till itself is destroyed. So it should be safe to keep that pointer. But care must be taken if module contains persistent plugins. Such modules stay in memory after factory is destroyed. So it is advisable to use obtained pointer only in constructor function of plugin.

The documentation for this class was generated from the following file:

- Plugin.h

5.239 Arc::PluginDesc Class Reference

Description of plugin.

```
#include <Plugin.h>
```

5.239.1 Detailed Description

Description of plugin. This class is used for reports

The documentation for this class was generated from the following file:

- `Plugin.h`

5.240 Arc::PluginDescriptor Struct Reference

Description of ARC loadable component.

```
#include <Plugin.h>
```

5.240.1 Detailed Description

Description of ARC loadable component.

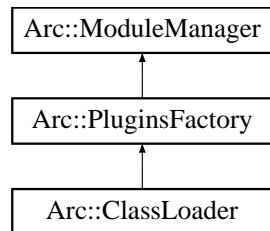

The documentation for this struct was generated from the following file:

- `Plugin.h`

5.241 Arc::PluginsFactory Class Reference

Generic ARC plugins loader.

```
#include <Plugin.h>
```

Public Member Functions

- `PluginsFactory (XMLNode cfg)`
- `void TryLoad (bool v)`
- `bool load (const std::string &name)`
- `bool scan (const std::string &name, ModuleDesc &desc)`
- `void report (std::list<ModuleDesc> &descs)`

Static Public Member Functions

- `static void FilterByKind (const std::string &kind, std::list<ModuleDesc> &descs)`

5.241.1 Detailed Description

Generic ARC plugins loader. The instance of this class provides functionality of loading pluggable ARC components stored in shared libraries. For more information please check HED documentation. This class is thread-safe - its methods are procteted from simultaneous use from multiple threads. Current thread protection implementation is suboptimal and will be revised in future.

5.241.2 Constructor & Destructor Documentation

5.241.2.1 Arc::PluginsFactory::PluginsFactory (XMLNode *cfg*)

Constructor - accepts configuration (not yet used) meant to tune loading of modules.

5.241.3 Member Function Documentation

5.241.3.1 static void Arc::PluginsFactory::FilterByKind (const std::string & *kind*, std::list<ModuleDesc> & *descs*) [static]

Filter list of modules by kind.

5.241.3.2 bool Arc::PluginsFactory::load (const std::string & name)

These methods load module named lib' name' and check if it contains ARC plugin(s) of specified 'kind' and 'name'. If there are no specified plugins or module does not contain any ARC plugins it is unloaded. All loaded plugins are also registered in internal list of this instance of [PluginsFactory](#) class. Returns true if any plugin was loaded.

5.241.3.3 void Arc::PluginsFactory::report (std::list<ModuleDesc> & descs)

Provides information about currently loaded modules and plugins.

5.241.3.4 bool Arc::PluginsFactory::scan (const std::string & name, ModuleDesc & desc)

Collect information about plugins stored in module(s) with specified names. Returns true if any of specified modules has plugins.

5.241.3.5 void Arc::PluginsFactory::TryLoad (bool v) [inline]

These methods load module named lib' name', locate plugin constructor functions of specified 'kind' and 'name' (if specified) and call it. Supplied argument affects way plugin instance is created in plugin-specific way. If name of plugin is not specified then all plugins of specified kind are tried with supplied argument till valid instance is created. All loaded plugins are also registered in internal list of this instance of [PluginsFactory](#) class. If search is set to false then no attempt is made to find plugins in loadable modules. Only plugins already loaded with previous calls to `get_instance()` and `load()` are checked. Returns created instance or NULL if failed. Specifies if loadable module may be loaded while looking for analyzing its content. If set to false only *.apd files are checked. Modules without corresponding *.apd will be ignored. Default is true;

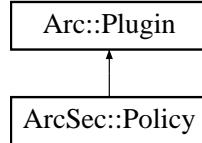

The documentation for this class was generated from the following file:

- `Plugin.h`

5.242 ArcSec::Policy Class Reference

Interface for containing and processing different types of policy.

```
#include <Policy.h>
```

Public Member Functions

- `Policy (Arc::PluginArgument *parg)`
- `Policy (const Arc::XMLNode, Arc::PluginArgument *parg)`
- `Policy (const Arc::XMLNode, EvaluatorContext *, Arc::PluginArgument *parg)`

- virtual std::string `getEffect () const =0`
- virtual `EvalResult & getEvalResult ()=0`
- virtual void `setEvalResult (EvalResult &res)=0`
- virtual const char * `getEvalName () const =0`
- virtual const char * `getName () const =0`

5.242.1 Detailed Description

Interface for containing and processing different types of policy. Basically, each policy object is a container which includes a few elements e.g., ArcPolicySet objects includes a few ArcPolicy objects; ArcPolicy object includes a few ArcRule objects. There is logical relationship between ArcRules or ArcPolicies, which is called combining algorithm. According to algorithm, evaluation results from the elements are combined, and then the combined evaluation result is returned to the up-level.

5.242.2 Constructor & Destructor Documentation

5.242.2.1 ArcSec::Policy::Policy (const Arc::XMLNode, Arc::PluginArgument * *parg*) [*inline*]

Template constructor - creates policy based on XML document. If XML document is empty then empty policy is created. If it is not empty then it must be valid policy document - otherwise created object should be invalid.

5.242.2.2 ArcSec::Policy::Policy (const Arc::XMLNode, EvaluatorContext *, Arc::PluginArgument * *parg*) [inline]

Template constructor - creates policy based on XML document. If XML document is empty then empty policy is created. If it is not empty then it must be valid policy document - otherwise created object should be invalid. This constructor is based on the policy node and i the [EvaluatorContext](#) which includes the factory objects for combining algorithm and function

5.242.3 Member Function Documentation**5.242.3.1 virtual void ArcSec::Policy::addPolicy (Policy * *pl*) [inline, virtual]**

Add a policy element to into "this" object

5.242.3.2 virtual Result ArcSec::Policy::eval (EvaluationCtx *) [pure virtual]

Evaluate policy For the <Rule> of [Arc](#), only get the "Effect" from rules; For the <Policy> of [Arc](#), combine the evaluation result from <Rule>; For the <Rule> of XACML, evaluate the <Condition> node by using information from request, and use the "Effect" attribute of <Rule>; For the <Policy> of XACML, combine the evaluation result from <Rule>

5.242.3.3 virtual std::string ArcSec::Policy::getEffect () const [pure virtual]

Get the "Effect" attribute

5.242.3.4 virtual const char* ArcSec::Policy::getEvalName () const [pure virtual]

Get the name of [Evaluator](#) which can evaluate this policy

5.242.3.5 virtual EvalResult& ArcSec::Policy::getEvalResult () [pure virtual]

Get evalution result

5.242.3.6 virtual const char* ArcSec::Policy::getName () const [pure virtual]

Get the name of this policy

5.242.3.7 virtual void ArcSec::Policy::make_policy () [inline, virtual]

Parse XMLNode, and construct the low-level Rule object

5.242.3.8 virtual void ArcSec::Policy::setEvalResult (EvalResult & *res*) [pure virtual]

Set evalution result

5.242.3.9 virtual void ArcSec::Policy::setEvaluatorContext (EvaluatorContext *) [inline, virtual]

Set [Evaluator](#) Context for the usage in creating low-level policy object

The documentation for this class was generated from the following file:

- Policy.h

5.243 ArcSec::PolicyStore::PolicyElement Class Reference

The documentation for this class was generated from the following file:

- PolicyStore.h

5.244 ArcSec::PolicyParser Class Reference

A interface which will isolate the policy object from actual policy storage (files, urls, database).

```
#include <PolicyParser.h>
```

Public Member Functions

- virtual `Policy * parsePolicy (const Source &source, std::string policyclassname, EvaluatorContext *ctx)`

5.244.1 Detailed Description

A interface which will isolate the policy object from actual policy storage (files, urls, database). Parse the policy from policy source (e.g. files, urls, database, etc.).

5.244.2 Member Function Documentation

5.244.2.1 virtual Policy* ArcSec::PolicyParser::parsePolicy (const Source & *source*, std::string *policyclassname*, EvaluatorContext * *ctx*) [virtual]

Parse policy

Parameters:

- source* location of the policy
- policyclassname* name of the policy for ClassLoader
- ctx* `EvaluatorContext` which includes the **Factory

The documentation for this class was generated from the following file:

- PolicyParser.h

5.245 ArcSec::PolicyStore Class Reference

Storage place for policy objects.

```
#include <PolicyStore.h>
```

Data Structures

- class [PolicyElement](#)

Public Member Functions

- [PolicyStore](#) (const std::string &*alg*, const std::string &*policyclassname*, [EvaluatorContext](#) **ctx*)

5.245.1 Detailed Description

Storage place for policy objects.

5.245.2 Constructor & Destructor Documentation

5.245.2.1 ArcSec::PolicyStore::PolicyStore (const std::string & *alg*, const std::string & *policyclassname*, EvaluatorContext * *ctx*)

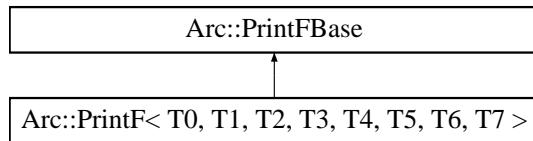

Creates policy store with specified combing algorithm (*alg* - not used yet), policy name (*policyclassname*) and context (*ctx*)

The documentation for this class was generated from the following file:

- PolicyStore.h

5.246 Arc::PrintF< T0, T1, T2, T3, T4, T5, T6, T7 > Class Template Reference

Inheritance diagram for Arc::PrintF< T0, T1, T2, T3, T4, T5, T6, T7 >::

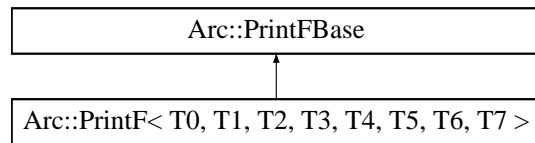

template<class T0 = int, class T1 = int, class T2 = int, class T3 = int, class T4 = int, class T5 = int, class T6 = int, class T7 = int> class Arc::PrintF< T0, T1, T2, T3, T4, T5, T6, T7 >

5.249 DataStaging::Processor Class Reference

The [Processor](#) performs pre- and post-transfer operations.

```
#include <Processor.h>Inheritance diagram for DataStaging::Processor:
```

Data Structures

- class **BulkThreadArgument**

Class used to pass information to spawned thread (for bulk operations).

- class **ThreadArgument**

Class used to pass information to spawned thread.

Public Member Functions

- [Processor \(\)](#)
- [~Processor \(\)](#)
- void [start \(void\)](#)
- void [stop \(void\)](#)
- virtual void [receiveDTR \(DTR_ptr dtr\)](#)

5.249.1 Detailed Description

The [Processor](#) performs pre- and post-transfer operations. The [Processor](#) takes care of everything that should happen before and after a transfer takes place. Calling [receiveDTR\(\)](#) spawns a thread to perform the required operation depending on the [DTR](#) state.

5.249.2 Member Function Documentation

5.249.2.1 virtual void DataStaging::Processor::receiveDTR (DTR_ptr dtr) [virtual]

Send a [DTR](#) to the [Processor](#). The [DTR](#) is sent to the [Processor](#) through this method when some long-latency processing is to be performed, eg contacting a remote service. The [Processor](#) spawns a thread to do the processing, and then returns. The thread notifies the scheduler when it is finished.

Implements [DataStaging::DTRCallback](#).

5.249.2.2 void DataStaging::Processor::start (void)

Start [Processor](#). This method actually does nothing. It is here only to make all classes of data staging to look alike. But it is better to call it before starting to use object because it may do something in the future.

5.249.2.3 void DataStaging::Processor::stop (void)

Stop [Processor](#). This method sends waits for all started threads to end and exits. Since threads a short-lived it is better to wait rather than interrupt them.

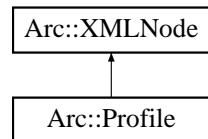

Referenced by [~Processor\(\)](#).

The documentation for this class was generated from the following file:

- Processor.h

- virtual QueryRowResult [get_row \(\) const =0](#)
- virtual std::string [get_row_field \(int row_number, std::string &field_name\)=0](#)
- virtual bool [get_array \(std::string &sqlstr, QueryArrayResult &result, std::vector< std::string > &arguments\)=0](#)

5.253.1 Constructor & Destructor Documentation

5.253.1.1 Arc::Query::Query () [inline]

Default constructor

5.253.1.2 Arc::Query::Query (Database * db) [inline]

Constructor

Parameters:

db The database object which will be used by [Query](#) class to get the database connection

5.253.1.3 virtual Arc::Query::~Query () [inline, virtual]

Deconstructor

5.253.2 Member Function Documentation

5.253.2.1 virtual bool Arc::Query::execute (const std::string & sqlstr) [pure virtual]

Execute the query

Parameters:

sqlstr The sql sentence used to query

Implemented in [Arc::MySQLQuery](#).

5.253.2.2 virtual bool Arc::Query::get_array (std::string & *sqlstr*, QueryArrayResult & *result*, std::vector< std::string > & *arguments*) [pure virtual]

Query the database by using some parameters into sql sentence e.g. "select table.value from table where table.name = ?"

Parameters:

sqlstr The sql sentence with some parameters marked with "?".

result The result in an array which includes all of the value in query result.

arguments The argument list which should exactly correspond with the parameters in sql sentence.

Implemented in [Arc::MySQLQuery](#).

5.253.2.3 virtual int Arc::Query::get_num_columns () [pure virtual]

Get the column number in the query result

Implemented in [Arc::MySQLQuery](#).

5.253.2.4 virtual int Arc::Query::get_num_rows () [pure virtual]

Get the row number in the query result

Implemented in [Arc::MySQLQuery](#).

5.253.2.5 virtual QueryRowResult Arc::Query::get_row () const [pure virtual]

Get the value of one row in the query result, the row number will be automatically increased each time the method is called

Implemented in [Arc::MySQLQuery](#).

5.253.2.6 virtual QueryRowResult Arc::Query::get_row (int *row_number*) const [pure virtual]

Get the value of one row in the query result

Parameters:

row_number The number of the row

Returns:

A vector includes all the values in the row

Implemented in [Arc::MySQLQuery](#).

5.253.2.7 virtual std::string Arc::Query::get_row_field (int *row_number*, std::string & *field_name*) [pure virtual]

Get the value of one specific field in one specific row

Parameters:

row_number The row number inside the query result

field_name The field name for the value which will be return

Returns:

The value of the specified filed in the specified row

Implemented in [Arc::MySQLQuery](#).

The documentation for this class was generated from the following file:

The documentation for this struct was generated from the following file:

- InfoRegister.h

5.256 Arc::RegisteredService Class Reference

[RegisteredService](#) - extension of [Service](#) performing self-registration.

```
#include <RegisteredService.h>Inheritance diagram for Arc::RegisteredService:::
```

Public Member Functions

- [RegisteredService \(Config *, PluginArgument *\)](#)

5.256.1 Detailed Description

[RegisteredService](#) - extension of [Service](#) performing self-registration.

5.256.2 Constructor & Destructor Documentation

5.256.2.1 Arc::RegisteredService::RegisteredService (Config *, PluginArgument *)

Example constructor - Server takes at least it's configuration subtree

The documentation for this class was generated from the following file:

- [RegisteredService.h](#)

5.257 Arc::RegularExpression Class Reference

A regular expression class.

```
#include <ArcRegex.h>
```

Public Member Functions

- `RegularExpression ()`
- `RegularExpression (std::string pattern)`
- `RegularExpression (const RegularExpression ®ex)`
- `~RegularExpression ()`
- `RegularExpression & operator= (const RegularExpression ®ex)`
- `bool isOk ()`
- `bool hasPattern (std::string str)`
- `bool match (const std::string &str) const`
- `bool match (const std::string &str, std::list< std::string > &unmatched, std::list< std::string > &matched) const`
- `std::string getPattern () const`

5.257.1 Detailed Description

A regular expression class. This class is a wrapper around the functions provided in regex.h.

5.257.2 Member Function Documentation

5.257.2.1 `bool Arc::RegularExpression::match (const std::string & str, std::list< std::string > & unmatched, std::list< std::string > & matched) const`

Returns true if this regex matches the string provided. Unmatched parts of the string are stored in 'unmatched'. Matched parts of the string are stored in 'matched'. The first entry in matched is the string that matched the regex, and the following entries are parenthesised elements of the regex

The documentation for this class was generated from the following file:

- `ArcRegex.h`

5.258 Arc::RemoteLoggingType Class Reference

Remote logging.

```
#include <JobDescription.h>
```

Data Fields

- std::string [ServiceType](#)
- [URL Location](#)
- bool [optional](#)

5.258.1 Detailed Description

Remote logging. This class is used to specify a service which should be used to report logging information to, such as job resource usage.

5.258.2 Field Documentation

5.258.2.1 URL Arc::RemoteLoggingType::Location

[URL](#) of logging service. The Location [URL](#) specifies the [URL](#) of the service which job logging information should be sent to.

5.258.2.2 bool Arc::RemoteLoggingType::optional

Requirement satisfaction switch. The optional boolean specifies whether the requirement specified in the particular object is mandatory for job execution, or whether it be ignored.

5.258.2.3 std::string Arc::RemoteLoggingType::ServiceType

Type of logging service. The ServiceType string specifies the type of logging service. Some examples are "SGAS" (<http://www.sgas.se>) and "APEL" (<https://wiki.egi.eu/wiki/APEL>), however please refer to the particular execution service for a list of supported logging service types.

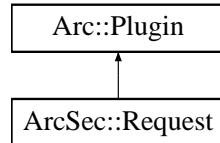

The documentation for this class was generated from the following file:

- JobDescription.h

5.259 ArcSec::Request Class Reference

Base class/Interface for request, includes a container for RequestItems and some operations.

#include <Request.h> Inheritance diagram for ArcSec::Request::

Public Member Functions

- virtual ReqItemList [getRequestItems \(\) const](#)
- virtual void [setRequestItems \(ReqItemList\)](#)
- virtual void [addRequestItem \(Attrs &, Attrs &, Attrs &, Attrs &\)](#)
- virtual void [setAttributeFactory \(AttributeFactory *attributefactory\)=0](#)
- virtual void [make_request \(\)=0](#)
- virtual const char * [getEvalName \(\) const =0](#)
- virtual const char * [getName \(\) const =0](#)
- [Request \(Arc::PluginArgument *parg\)](#)
- [Request \(const Source &, Arc::PluginArgument *parg\)](#)

5.259.1 Detailed Description

Base class/Interface for request, includes a container for RequestItems and some operations. A [Request](#) object can has a few <subjects, actions, objects> tuples, i.e. [RequestItem](#) The [Request](#) class and any customized class which inherit from it, should be loadable, which means these classes can be dynamically loaded according to the configuration information, see the example configuration below: <Service name="pdp.service" id="pdp_service"> <pdp:PDPCConfig> <.....> <pdp:Request name="arc.request" /> <.....> </pdp:PDPCConfig> </Service>

There can be different types of subclass which inherit [Request](#), such like XACMLRequest, ArcRequest, GACLRequest

5.259.2 Constructor & Destructor Documentation

5.259.2.1 ArcSec::Request::Request (Arc::PluginArgument **parg*) [inline]

Default constructor

5.259.2.2 ArcSec::Request::Request (const Source &, Arc::PluginArgument **parg*) [inline]

Constructor: Parse request information from a xml stucture in memory

5.259.3 Member Function Documentation

5.259.3.1 virtual void ArcSec::Request::addRequestItem (Attrs &, Attrs &, Attrs &, Attrs &) [inline, virtual]

Add request tuple from non-XMLNode

5.259.3.2 virtual const char* ArcSec::Request::getEvalName () const [pure virtual]

Get the name of corresponding evaluator

5.259.3.3 virtual const char* ArcSec::Request::getName () const [pure virtual]

Get the name of this request

5.259.3.4 virtual ReqItemList ArcSec::Request::getRequestItems () const [inline, virtual]

Get all the [RequestItem](#) inside [RequestItem](#) container

5.259.3.5 virtual void ArcSec::Request::make_request () [pure virtual]

Create the objects included in [Request](#) according to the node attached to the [Request](#) object

5.259.3.6 virtual void ArcSec::Request::setAttributeFactory (AttributeFactory * *attributefactory*) [pure virtual]

Set the attribute factory for the usage of [Request](#)

5.259.3.7 virtual void ArcSec::Request::setRequestItems (ReqItemList) [inline, virtual]

Set the content of the container

The documentation for this class was generated from the following file:

- Request.h

5.260 ArcSec::RequestAttribute Class Reference

Wrapper which includes [AttributeValue](#) object which is generated according to date type of one specific node in Request.xml.

```
#include <RequestAttribute.h>
```

Public Member Functions

- [RequestAttribute \(Arc::XMLNode &node, AttributeFactory *attrfactory\)](#)
- [RequestAttribute & duplicate \(RequestAttribute &\)](#)

5.260.1 Detailed Description

Wrapper which includes [AttributeValue](#) object which is generated according to date type of one specific node in Request.xml.

5.260.2 Constructor & Destructor Documentation

5.260.2.1 ArcSec::RequestAttribute::RequestAttribute (Arc::XMLNode & *node*, AttributeFactory * *attrfactory*)

Constructor - create attribute value object according to the "Type" in the node <Attribute attributeid="urn:arc:subject:voms-attribute" type="string">urn:mace:shibboleth:examples</Attribute>

5.260.3 Member Function Documentation

5.260.3.1 RequestAttribute& ArcSec::RequestAttribute::duplicate (RequestAttribute &)

Duplicate the parameter into "this"

The documentation for this class was generated from the following file:

- RequestAttribute.h

5.261 ArcSec::RequestItem Class Reference

Interface for request item container, <subjects, actions, objects, ctxs> tuple.

```
#include <RequestItem.h>
```

Public Member Functions

- [RequestItem \(Arc::XMLNode &, AttributeFactory *\)](#)

5.261.1 Detailed Description

Interface for request item container, <subjects, actions, objects, ctxs> tuple.

5.261.2 Constructor & Destructor Documentation

5.261.2.1 ArcSec::RequestItem::RequestItem (Arc::XMLNode &, AttributeFactory *) [inline]

Constructor

Parameters:

node The XMLNode structure of the request item

attributefactory The [AttributeFactory](#) which will be used to generate [RequestAttribute](#)

The documentation for this class was generated from the following file:

- RequestItem.h

5.262 ArcSec::RequestTuple Class Reference

The documentation for this class was generated from the following file:

- EvaluationCtx.h

5.263 Arc::ResourcesType Class Reference

The documentation for this class was generated from the following file:

- JobDescription.h

5.264 ArcSec::Response Class Reference

Container for the evaluation results.

```
#include <Response.h>
```

5.264.1 Detailed Description

Container for the evaluation results.

The documentation for this class was generated from the following file:

- Response.h

5.265 ArcSec::ResponseItem Class Reference

Evaluation result concerning one [RequestTuple](#).

```
#include <Response.h>
```

5.265.1 Detailed Description

Evaluation result concerning one [RequestTuple](#). Include the [RequestTuple](#), related XMLNode, the set of policy objects which give positive evaluation result, and the related XMLNode

The documentation for this class was generated from the following file:

- Response.h

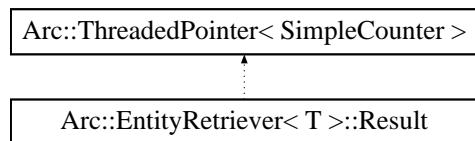

5.266 ArcSec::ResponseList Class Reference

The documentation for this class was generated from the following file:

- Response.h

5.267 Arc::EntityRetriever< T >::Result Class Reference

Inheritance diagram for Arc::EntityRetriever< T >::Result::

template<typename T> class Arc::EntityRetriever< T >::Result

The documentation for this class was generated from the following file:

- EntityRetriever.h

5.268 Arc::Run Class Reference

```
#include <Run.h>
```

Public Member Functions

- [Run](#) (const std::string &cmdline)
- [Run](#) (const std::list< std::string > &argv)
- [~Run](#) (void)
- [operator bool](#) (void)

- [Time RunTime](#) (void)
- [Time ExitTime](#) (void)
- [int ReadStdout](#) (int timeout, char *buf, int size)
- [int ReadStderr](#) (int timeout, char *buf, int size)
- [int WriteStdin](#) (int timeout, const char *buf, int size)
- [void AssignStdout](#) (std::string &str)
- [void AssignStderr](#) (std::string &str)
- [void AssignStdin](#) (std::string &str)
- [void KeepStdout](#) (bool keep=true)
- [void KeepStderr](#) (bool keep=true)
- [void KeepStdin](#) (bool keep=true)
- [void CloseStdout](#) (void)
- [void CloseStderr](#) (void)
- [void CloseStdin](#) (void)
- [void AssignWorkingDirectory](#) (std::string &wd)
- [void Kill](#) (int timeout)
- [void Abandon](#) (void)

Static Public Member Functions

- static void [AfterFork](#) (void)

5.268.1 Detailed Description

This class runs external executable. It is possible to read/write it's standard handles or to redirect them to std::string elements.

5.268.2 Constructor & Destructor Documentation

5.268.2.1 Arc::Run::Run (const std::string & *cmdline*)

Constructor prepares object to run cmdline

5.268.2.2 Arc::Run::Run (const std::list< std::string > & argv)

Constructor prepares object to run executable and arguments specified in argv

5.268.2.3 Arc::Run::~Run (void)

Destructor kills running executable and releases associated resources

5.268.3 Member Function Documentation**5.268.3.1 void Arc::Run::Abandon (void)**

Detach this object from running process. After calling this method instance is not associated with external process anymore. As result destructor will not kill process.

5.268.3.2 static void Arc::Run::AfterFork (void) [static]

Call this method after fork() in child process. It will reinitialize internal structures for new environment. Do not call it in any other case than defined.

5.268.3.3 void Arc::Run::AssignStderr (std::string & str)

Associate stderr handle of executable with string. This method must be called before [Start\(\)](#). str object must be valid as long as this object exists.

5.268.3.4 void Arc::Run::AssignStdin (std::string & str)

Associate stdin handle of executable with string. This method must be called before [Start\(\)](#). str object must be valid as long as this object exists.

5.268.3.5 void Arc::Run::AssignStdout (std::string & str)

Associate stdout handle of executable with string. This method must be called before [Start\(\)](#). str object must be valid as long as this object exists.

5.268.3.6 void Arc::Run::AssignWorkingDirectory (std::string & wd) [inline]

Assign working directory of the running process

5.268.3.7 void Arc::Run::CloseStderr (void)

Closes pipe associated with stderr handle

5.268.3.8 void Arc::Run::CloseStdin (void)

Closes pipe associated with stdin handle

5.268.3.9 void Arc::Run::CloseStdout (void)

Closes pipe associated with stdout handle

5.268.3.10 Time Arc::Run::ExitTime (void) [inline]

Return when executable finished executing.

5.268.3.11 void Arc::Run::KeepStderr (bool *keep* = true)

Keep stderr same as parent's if keep = true

5.268.3.12 void Arc::Run::KeepStdin (bool *keep* = true)

Keep stdin same as parent's if keep = true

5.268.3.13 void Arc::Run::KeepStdout (bool *keep* = true)

Keep stdout same as parent's if keep = true

5.268.3.14 void Arc::Run::Kill (int *timeout*)

Kill running executable. First soft kill signal (SIGTERM) is sent to executable. If after timeout seconds executable is still running it's killed completely. Currently this method does not work for Windows OS

5.268.3.15 Arc::Run::operator bool (void) [inline]

Returns true if object is valid

5.268.3.16 bool Arc::Run::operator! (void) [inline]

Returns true if object is invalid

5.268.3.17 int Arc::Run::ReadStderr (int *timeout*, char * *buf*, int *size*)

Read from stderr handle of running executable. Parameter timeout specifies upper limit for which method will block in milliseconds. Negative means infinite. This method may be used while stderr is directed to string. But result is unpredictable. Returns number of read bytes.

5.268.3.18 int Arc::Run::ReadStdout (int *timeout*, char * *buf*, int *size*)

Read from stdout handle of running executable. Parameter timeout specifies upper limit for which method will block in milliseconds. Negative means infinite. This method may be used while stdout is directed to string. But result is unpredictable. Returns number of read bytes.

5.268.3.19 int Arc::Run::Result (void) [inline]

Returns exit code of execution.

5.268.3.20 bool Arc::Run::Running (void)

Return true if execution is going on.

5.268.3.21 Time Arc::Run::RunTime (void) [inline]

Return when executable was started.

5.268.3.22 bool Arc::Run::Start (void)

Starts running executable. This method may be called only once.

5.268.3.23 bool Arc::Run::Wait (void)

Wait till execution finished

5.268.3.24 bool Arc::Run::Wait (int *timeout*)

Wait till execution finished or till timeout seconds expires. Returns true if execution is complete.

5.268.3.25 int Arc::Run::WriteStdin (int *timeout*, const char * *buf*, int *size*)

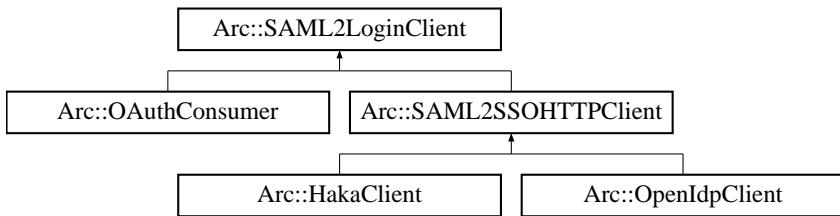

Write to stdin handle of running executable. Parameter timeout specifies upper limit for which method will block in milliseconds. Negative means infinite. This method may be used while stdin is directed to string. But result is unpredictable. Returns number of written bytes.

The documentation for this class was generated from the following file:

- Run.h

5.269 Arc::SAML2LoginClient Class Reference

Inheritance diagram for Arc::SAML2LoginClient:::

Public Member Functions

- [SAML2LoginClient](#) (const [MCCConfig](#) *cfg*, const [URL](#) *url*, std::list< std::string > *idp_stack*)
- virtual [MCC_Status](#) [processLogin](#) (const std::string *username*= "", const std::string *password*= "")=0
- [MCC_Status](#) [findSimpleSAMLInstallation](#) ()

5.269.1 Constructor & Destructor Documentation

5.269.1.1 [Arc::SAML2LoginClient::SAML2LoginClient](#) (const [MCCConfig](#) *cfg*, const [URL](#) *url*, std::list< std::string > *idp_stack*)

list with the idp for nested wayf For example, Confusa can use betawayf.wayf.dk as an identity provider, which is itself only a wayf and shares the metadata with concrete service providers or even further nested wayfs. Since due to mutual authentication with metadata, we are obliged to follow the SSO redirects from WAYF to WAYF, the WAYFs are stored in a list.

5.269.2 Member Function Documentation

5.269.2.1 [MCC_Status](#) [Arc::SAML2LoginClient::findSimpleSAMLInstallation](#) ()

find the location of the simplesamlphp installation on the SP side Will be stored in (*sso_pages)[SimpleSAML]

5.269.2.2 virtual [MCC_Status](#) [Arc::SAML2LoginClient::processLogin](#) (const std::string *username* = "", const std::string *password* = "") [pure virtual]

Base interface for all login procedures

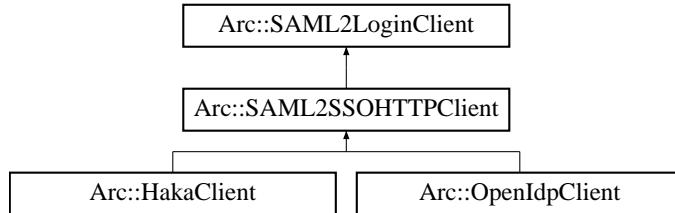

Implemented in [Arc::OAuthConsumer](#), and [Arc::SAML2SSOHTTPClient](#).

The documentation for this class was generated from the following file:

- [SAML2LoginClient.h](#)

5.270 Arc::SAML2SSOHTTPClient Class Reference

5.270.1 Member Function Documentation

5.270.1.1 [MCC_Status Arc::SAML2SSOHTTPClient::approveCSR \(const std::string& approve_page\) \[virtual\]](#)

Simulate click on the approve cert signing request link

Implements [Arc::SAML2LoginClient](#).

5.270.1.2 [MCC_Status Arc::SAML2SSOHTTPClient::parseDN \(std::string * dn\) \[virtual\]](#)

Parse the used DN from the Confusa about_you page

Implements [Arc::SAML2LoginClient](#).

5.270.1.3 [virtual MCC_Status Arc::SAML2SSOHTTPClient::processConsent \(\) \[protected, pure virtual\]](#)

If the IdP has a consent module and the user has not saved her consent, this method will ask the user for consent to transmission of her data to Confusa

Implemented in [Arc::HakaClient](#), and [Arc::OpenIdpClient](#).

5.270.1.4 virtual MCC_Status Arc::SAML2SSOHTTPClient::processIdP2Confusa () [protected, pure virtual]

Redirects the user back from identity provider to the Confusa SP

Implemented in [Arc::HakaClient](#), and [Arc::OpenIdpClient](#).

5.270.1.5 virtual MCC_Status Arc::SAML2SSOHTTPClient::processIdPLogin (const std::string username, const std::string password) [protected, pure virtual]

Actual identity provider parsers for next three methods implemented in subdirectory idp/

Parse identity provider login page and submit username and password in the previsioned way

Implemented in [Arc::HakaClient](#), and [Arc::OpenIdpClient](#).

5.270.1.6 MCC_Status Arc::SAML2SSOHTTPClient::processLogin (const std::string username, const std::string password) [virtual]

Models complete SAML2 WebSSO authN flow with start -> WAYF -> Login -> (consent) -> start

Implements [Arc::SAML2LoginClient](#).

5.270.1.7 MCC_Status Arc::SAML2SSOHTTPClient::pushCSR (const std::string b64_pub_key, const std::string pub_key_hash, std::string * approve_page) [virtual]

Send the cert signing request to Confusa for signing

Implements [Arc::SAML2LoginClient](#).

5.270.1.8 MCC_Status Arc::SAML2SSOHTTPClient::storeCert (const std::string cert_path, const std::string auth_token, const std::string b64_dn) [virtual]

Download the signed certificate from Confusa and store it locally

Implements [Arc::SAML2LoginClient](#).

The documentation for this class was generated from the following file:

- [SAML2LoginClient.h](#)

5.271 Arc::SAMLToken Class Reference

Class for manipulating SAML Token [Profile](#).

```
#include <SAMLToken.h>
```

Public Types

- enum [SAMLVersion](#)

Public Member Functions

- [SAMLToken \(SOAPEnvelope &soap\)](#)
- [SAMLToken \(SOAPEnvelope &soap, const std::string &certfile, const std::string &keyfile, \[SAMLVVersion\]\(#\) saml_version=SAML2, \[XMLNode\]\(#\) saml_assertion=\[XMLNode\\(\\)\]\(#\)\)](#)
- [~SAMLToken \(void\)](#)
- [operator bool \(void\)](#)
- [bool Authenticate \(const std::string &cafle, const std::string &capath\)](#)
- [bool Authenticate \(void\)](#)

5.271.1 Detailed Description

Class for manipulating SAML Token [Profile](#). This class is for generating/consuming SAML Token profile. See WS-Security SAML Token [Profile](#) v1.1 (www.oasis-open.org/committees/wss) Currently this class is used by samltoken handler (will appears in src/hed/pdc/samltokensh/) It is not a must to directly called this class. If we need to use SAML Token functionality, we only need to configure the samltoken handler into service and client. Currently, only a minor part of the specification has been implemented.

About how to identify and reference security token for signing message, currently, only the "SAML Assertion Referenced from KeyInfo" (part 3.4.2 of WS-Security SAML Token [Profile](#) v1.1 specification) is supported, which means the implementation can only process SAML assertion "referenced from KeyInfo", and also can only generate SAML Token with SAML assertion "referenced from KeyInfo". More complete support need to implement.

About subject confirmation method, the implementation can process "hold-of-key" (part 3.5.1 of WS-Security SAML Token [Profile](#) v1.1 specification) subject subject confirmation method.

About SAML verson, the implementation can process SAML assertion with SAML version 1.1 and 2.0; can only generate SAML assertion with SAML verson 2.0.

In the SAML Token profile, for the hold-of-key subject confirmation method, there are three interaction parts: the attesting entity, the relying party and the issuing authority. In the hold-of-key subject confirmation method, it is the attesting entity's subject identity which will be inserted into the SAML assertion.

Firstly the attesting entity authenticates to issuing authority by using some authentication scheme such as WSS x509 Token profile (Alterbatively the username/password authentication scheme or other different authentication scheme can also be used, unless the issuing authority can retrive the key from a trusted certificate server after firmly establishing the subject's identity under the username/password scheme). So then issuing authority is able to make a definitive statement (sign a SAML assertion) about an act of authentication that has already taken place.

The attesting entity gets the SAML assertion and then signs the soap message together with the assertion by using its private key (the relevant certificate has been authenticated by issuing authority, and its relevant public key has been put into SubjectConfirmation element under saml assertion by issuing authority. Only

the actual owner of the saml assertion can do this, as only the subject possesses the private key paired with the public key in the assertion. This establishes an irrefutable connection between the author of the SOAP message and the assertion describing an authentication event.)

The relying party is supposed to trust the issuing authority. When it receives a message from the asserting entity, it will check the saml assertion based on its predetermined trust relationship with the SAML issuing authority, and check the signature of the soap message based on the public key in the saml assertion without directly trust relationship with attesting entity (subject owner).

5.271.2 Member Enumeration Documentation

5.271.2.1 enum Arc::SAMLToken::SAMLVersion

Since the specification SAMLVersion is for distinguishing two types of saml version. It is used as the parameter of constructor.

5.271.3 Constructor & Destructor Documentation

5.271.3.1 Arc::SAMLToken::SAMLToken (SOAPEnvelope & *soap*)

Constructor. Parse SAML Token information from SOAP header. SAML Token related information is extracted from SOAP header and stored in class variables. And then it the [SAMLToken](#) object will be used for authentication.

Parameters:

soap The SOAP message which contains the [SAMLToken](#) in the soap header

5.271.3.2 Arc::SAMLToken::SAMLToken (SOAPEnvelope & *soap*, const std::string & *certfile*, const std::string & *keyfile*, SAMLVersion *saml_version* = **SAML2**, XMLNode *saml_assertion* = XMLNode ())

Constructor. Add SAML Token information into the SOAP header. Generated token contains elements SAML token and signature, and is meant to be used for authentication on the consuming side. This constructor is for a specific SAML Token profile usage, in which the attesting entity signs the SAML assertion for itself (self-sign). This usage implicitly requires that the relying party trust the attesting entity. More general (requires issuing authority) usage will be provided by other constructor. And the under-developing SAML service will be used as the issuing authority.

Parameters:

soap The SOAP message to which the SAML Token will be inserted.

certfile The certificate file.

keyfile The key file which will be used to create signature.

samlversion The SAML version, only SAML2 is supported currently.

samlassertion The SAML assertion got from 3rd party, and used for protecting the SOAP message; If not present, then self-signed assertion will be generated.

5.271.3.3 Arc::SAMLToken::~SAMLToken (void)

Deconstructor. Nothing to be done except finalizing the xmlsec library.

5.271.4 Member Function Documentation

5.271.4.1 bool Arc::SAMLToken::Authenticate (void)

Check signature by using the cert information in soap message

5.271.4.2 bool Arc::SAMLToken::Authenticate (const std::string & *cafile*, const std::string & *capath*)

Check signature by using the trusted certificates It is used by relying parting after calling [SAMLToken\(SOAPEnvelope& soap\)](#) This method will check the SAML assertion based on the trusted certificates specified as parameter *cafile* or *capath*; and also check the signature to soap message (the signature is generated by attesting entity by signing soap body together with SAML assertion) by using the public key inside SAML assetion.

Parameters:

cafile ca file

capath ca directory

5.271.4.3 Arc::SAMLToken::operator bool (void)

Returns true if constructor succeeded

- void [SetRemoteSizeLimit](#) (unsigned long long int limit)
- void [SetDumpLocation](#) (const std::string &location)
- bool [start](#) (void)
- virtual void [receiveDTR](#) ([DTR_ptr](#) dtr)
- bool [cancelDTRs](#) (const std::string &jobid)
- bool [stop](#) ()

5.274.1 Detailed Description

The [Scheduler](#) is the control centre of the data staging framework. The [Scheduler](#) manages a global list of DTRs and schedules when they should go into the next state or be sent to other processes. The [DTR](#) priority is used to decide each DTR's position in a queue.

5.274.2 Member Function Documentation

5.274.2.1 virtual void DataStaging::Scheduler::receiveDTR ([DTR_ptr](#) dtr) [virtual]

Callback method implemented from [DTRCallback](#). This method is called by the generator when it wants to pass a [DTR](#) to the scheduler and when other processes send a [DTR](#) back to the scheduler after processing.

Implements [DataStaging::DTRCallback](#).

5.274.2.2 bool DataStaging::Scheduler::start (void)

Start scheduling activity. This method must be called after all configuration parameters are set properly. [Scheduler](#) can be stopped either by calling [stop\(\)](#) method or by destroying its instance.

5.274.2.3 bool DataStaging::Scheduler::stop ()

Tell the [Scheduler](#) to shut down all threads and exit. All active DTRs are cancelled and this method waits until they finish (all DTRs go to CANCELLED state)

Referenced by [~Scheduler\(\)](#).

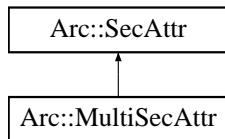

The documentation for this class was generated from the following file:

- Scheduler.h

5.275 Arc::SecAttr Class Reference

This is an abstract interface to a security attribute.

```
#include <SecAttr.h>
```

Public Member Functions

- `SecAttr()`
- `bool operator==(const SecAttr &b) const`
- `bool operator!=(const SecAttr &b) const`
- `virtual operator bool() const`
- `virtual bool Export(SecAttrFormat format, std::string &val) const`
- `virtual bool Export(SecAttrFormat format, XMLNode &val) const`
- `virtual bool Import(SecAttrFormat format, const std::string &val)`
- `virtual std::string get(const std::string &id) const`
- `virtual std::list<std::string> getAll(const std::string &id) const`

Static Public Attributes

- static `SecAttrFormat ARCAuth`
- static `SecAttrFormat XACML`
- static `SecAttrFormat SAML`
- static `SecAttrFormat GACL`

5.275.1 Detailed Description

This is an abstract interface to a security attribute. This class is meant to be inherited to implement security attributes. Depending on what data it needs to store inheriting classes may need to implement constructor and destructor. They must however override the equality and the boolean operators. The equality is meant to compare security attributes. The prototype implies that all attributes are comparable to all others. This behaviour should be modified as needed by using dynamic_cast operations. The boolean cast operation is meant to embody "nullness" if that is applicable to the particular type.

5.275.2 Member Function Documentation

5.275.2.1 `virtual bool Arc::SecAttr::Export (SecAttrFormat format, XMLNode & val) const [virtual]`

Convert internal structure into specified format. Returns false if format is not supported/suitable for this attribute. XML node referenced by is turned into top level element of specified format.

Reimplemented in [Arc::MultiSecAttr](#).

5.275.2.2 virtual bool Arc::SecAttr::Export (SecAttrFormat *format*, std::string & *val*) const [virtual]

Convert internal structure into specified format. Returns false if format is not supported/suitable for this attribute.

5.275.2.3 virtual std::string Arc::SecAttr::get (const std::string & *id*) const [virtual]

Access to specific item of the security attribute. If there are few items of same id the first one is presented. It is meant to be used for tightly coupled SecHandlers and provides more effective interface than Export.

5.275.2.4 virtual std::list<std::string> Arc::SecAttr::getAll (const std::string & *id*) const [virtual]

Access to specific items of the security attribute. This method returns all items which have id assigned. It is meant to be used for tightly coupled SecHandlers and provides more effective interface than Export.

5.275.2.5 virtual bool Arc::SecAttr::Import (SecAttrFormat *format*, const std::string & *val*) [virtual]

Fills internal structure from external object of specified format. Returns false if failed to do. The usage pattern for this method is not defined and it is provided only to make class symmetric. Hence its implementation is not required yet.

5.275.2.6 virtual Arc::SecAttr::operator bool () const [virtual]

This function should return false if the value is to be considered null, e.g. if it hasn't been set or initialized. In other cases it should return true.

Reimplemented in [Arc::MultiSecAttr](#).

5.275.2.7 bool Arc::SecAttr::operator!= (const SecAttr & *b*) const [inline]

This is a convenience function to allow the usage of "not equal" conditions and need not be overridden.

5.275.2.8 bool Arc::SecAttr::operator== (const SecAttr & *b*) const [inline]

This function should (in inheriting classes) return true if this and b are considered to represent same content. Identifying and restricting the type of b should be done using dynamic_cast operations. Currently it is not defined how comparison methods to be used. Hence their implementation is not required.

The documentation for this class was generated from the following file:

- SecAttr.h

5.276 Arc::SecAttrFormat Class Reference

Export/import format.

```
#include <SecAttr.h>
```

5.276.1 Detailed Description

Export/import format. Format is identified by textual identity string. Class description includes basic formats only. That list may be extended.

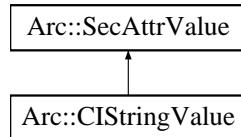

The documentation for this class was generated from the following file:

- SecAttr.h

5.277 Arc::SecAttrValue Class Reference

This is an abstract interface to a security attribute.

```
#include <SecAttrValue.h>Inheritance diagram for Arc::SecAttrValue::
```

Public Member Functions

- bool `operator== (SecAttrValue &b)`
- bool `operator!= (SecAttrValue &b)`
- virtual `operator bool ()`

5.277.1 Detailed Description

This is an abstract interface to a security attribute. This class is meant to be inherited to implement security attributes. Depending on what data it needs to store inheriting classes may need to implement constructor and destructor. They must however override the equality and the boolean operators. The equality is meant to compare security attributes. The prototype implies that all attributes are comparable to all others. This behaviour should be modified as needed by using dynamic_cast operations. The boolean cast operation is meant to embody "nullness" if that is applicable to the particular type.

5.277.2 Member Function Documentation

5.277.2.1 virtual Arc::SecAttrValue::operator bool () [virtual]

This function should return false if the value is to be considered null, e g if it hasn't been set or initialized. In other cases it should return true.

Reimplemented in [Arc::CIStringValue](#).

5.277.2.2 bool Arc::SecAttrValue::operator!= (SecAttrValue & b)

This is a convenience function to allow the usage of "not equal" conditions and need not be overridden.

5.277.2.3 bool Arc::SecAttrValue::operator== (SecAttrValue & b)

This function should (in inheriting classes) return true if this and b are considered to be the same. Identifying and restricting the type of b should be done using dynamic_cast operations.

The documentation for this class was generated from the following file:

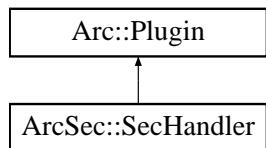

- `SecAttrValue.h`

5.278 ArcSec::SecHandler Class Reference

Base class for simple security handling plugins.

```
#include <SecHandler.h>
```

Inheritance diagram for ArcSec::SecHandler::

5.278.1 Detailed Description

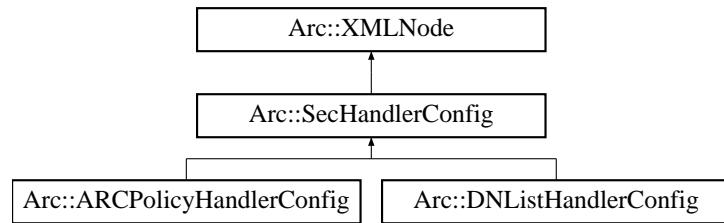

Base class for simple security handling plugins. This virtual class defines method Handle() which processes security related information/attributes in Message and optionally makes security decision. Instances of such classes are normally arranged in chains and are called on incoming and outgoing messages in various MCC and Service plugins. Return value of Handle() defines either processing should continue (true) or stop with error (false). Configuration of [SecHandler](#) is consumed during creation of instance through XML subtree fed to constructor.

The documentation for this class was generated from the following file:

- [SecHandler.h](#)

Protected Attributes

- std::map< std::string, std::list< [ArcSec::SecHandler](#) * > > [sechandlers_](#)
- bool [valid](#)

Static Protected Attributes

- static [Logger logger](#)

5.283.1 Detailed Description

[Service](#) - last component in a [Message](#) Chain. This class which defines interface and common functionality for every [Service](#) plugin. Interface is made of method [process\(\)](#) which is called by [Plexer](#) or [MCC](#) class. There is one [Service](#) object created for every service description processed by [Loader](#) class objects. Classes derived from [Service](#) class must implement [process\(\)](#) method of [MCCInterface](#). It is up to developer how internal state of service is stored and communicated to other services and external utilities. [Service](#) is free to expect any type of payload passed to it and generate any payload as well. Useful types depend on MCCs in chain which leads to that service. For example if service is expected to be linked to SOAP [MCC](#) it

must accept and generate messages with [PayloadSOAP](#) payload. Method `process()` of class derived from [Service](#) class may be called concurrently in multiple threads. Developers must take that into account and write thread-safe implementation. Simple example of service is provided in `/src/tests/echo/echo.cpp` of source tree. The way to write client counterpart of corresponding service is undefined yet. For example see `/src/tests/echo/test.cpp`.

5.283.2 Constructor & Destructor Documentation

5.283.2.1 `Arc::Service::Service (Config *, PluginArgument * arg)`

Example constructor - Server takes at least its configuration subtree

5.283.3 Member Function Documentation

5.283.3.1 `virtual void Arc::Service::AddSecHandler (Config * cfg, ArcSec::SecHandler * sechandler, const std::string & label = "") [virtual]`

Add security components/handlers to this [MCC](#). For more information please see description of [MCC::AddSecHandler](#)

5.283.3.2 `virtual std::string Arc::Service::getID () [inline, virtual]`

[Service](#) may implement own service identifier gathering method. This method return identifier of service which is used for registering it Information Services.

5.283.3.3 `Arc::Service::operator bool (void) const [inline]`

Returns true if the [Service](#) is valid.

References valid.

5.283.3.4 `bool Arc::Service::operator! (void) const [inline]`

Returns true if the [Service](#) is not valid.

References valid.

5.283.3.5 `bool Arc::Service::ProcessSecHandlers (Message & message, const std::string & label = "") const [protected]`

Executes security handlers of specified queue. For more information please see description of [MCC::ProcessSecHandlers](#)

5.283.3.6 `virtual bool Arc::Service::RegistrationCollector (XMLNode & doc) [virtual]`

[Service](#) specific registration collector, used for generate service registrations. In implemented service this method should generate [GLUE2](#) document with part of service description which service wishes to advertise to Information Services.

5.283.4 Field Documentation

5.283.4.1 **Logger** `Arc::Service::logger` [**static, protected**]

`Logger` object used to print messages generated by this class.

5.283.4.2 `std::map<std::string, std::list<ArcSec::SecHandler*>>` **Arc::Service::sechandlers_** [**protected**]

Set of labelled authentication and authorization handlers. `MCC` calls sequence of handlers at specific point depending on associated identifier. in most cases those are "in" and "out" for incoming and outgoing messages correspondingly.

5.283.4.3 `bool Arc::Service::valid` [**protected**]

Is service valid? Services which are not valid should set this to false in their constructor.

Referenced by operator `bool()`, and operator `!()`.

5.287 Arc::SimpleCondition Class Reference

Simple triggered condition.

```
#include <Thread.h>
```

Public Member Functions

- void **lock** (void)
- void **unlock** (void)
- void **signal** (void)
- void **signal_nonblock** (void)
- void **broadcast** (void)
- void **wait** (void)
- void **wait_nonblock** (void)
- bool **wait** (int t)
- void **reset** (void)

5.287.1 Detailed Description

Simple triggered condition. Provides condition and semaphor objects in one element.

5.287.2 Member Function Documentation

5.287.2.1 void Arc::SimpleCondition::broadcast (void) [inline]

Signal about condition to all waiting threads. If there are no waiting threads, it works like [signal\(\)](#).

5.287.2.2 void Arc::SimpleCondition::lock (void) [inline]

Acquire semaphor

5.287.2.3 void Arc::SimpleCondition::reset (void) [inline]

Reset object to initial state

5.287.2.4 void Arc::SimpleCondition::signal (void) [inline]

Signal about condition. This overrides [broadcast\(\)](#).

5.287.2.5 void Arc::SimpleCondition::signal_nonblock (void) [inline]

Signal about condition without using semaphor. Call it *only* with lock acquired.

5.287.2.6 void Arc::SimpleCondition::unlock (void) [inline]

Release semaphor

5.287.2.7 bool Arc::SimpleCondition::wait (int *t*) [inline]

Wait for condition no longer than *t* milliseconds

5.287.2.8 void Arc::SimpleCondition::wait (void) [inline]

Wait for condition

5.287.2.9 void Arc::SimpleCondition::wait_nonblock (void) [inline]

Wait for condition without using semaphore. Call it **only** with lock acquired.

The documentation for this class was generated from the following file:

- Thread.h

5.288 Arc::SimpleCounter Class Reference

```
#include <Thread.h>
```

Public Member Functions

- virtual int `inc` (void)
- virtual int `dec` (void)
- virtual int `get` (void) const
- virtual int `set` (int v)
- virtual void `wait` (void) const
- virtual bool `wait` (int t) const
- virtual void `forceReset` (void)

5.288.1 Detailed Description

Thread-safe counter with capability to wait for zero value. It is extendable through re-implementation of virtual methods.

5.288.2 Member Function Documentation

5.288.2.1 virtual int Arc::SimpleCounter::dec (void) [virtual]

Decrement value of counter. Returns new value. Does not go below 0 value.

5.288.2.2 virtual void Arc::SimpleCounter::forceReset (void) [inline, virtual]

This method is meant to be used only after fork. It resets state of all internal locks and variables.

5.288.2.3 virtual int Arc::SimpleCounter::inc (void) [virtual]

Increment value of counter. Returns new value.

5.288.2.4 virtual int Arc::SimpleCounter::set (int v) [virtual]

Set value of counter. Returns new value.

5.288.2.5 virtual bool Arc::SimpleCounter::wait (int t) const [virtual]

Wait for zero condition no longer than t milliseconds. If t is negative - wait forever.

The documentation for this class was generated from the following file:

- Thread.h

5.289 Arc::SlotRequirementType Class Reference

5.290 Arc::SOAPMessage Class Reference

[Message](#) restricted to SOAP payload.

```
#include <SOAPMessage.h>
```

Public Member Functions

- [SOAPMessage \(void\)](#)
- [SOAPMessage \(long msg_ptr_addr\)](#)
- [SOAPMessage \(Message &msg\)](#)
- [~SOAPMessage \(void\)](#)
- [SOAPEnvelope * Payload \(void\)](#)
- [void Payload \(SOAPEnvelope *new_payload\)](#)
- [MessageAttributes * Attributes \(void\)](#)

5.290.1 Detailed Description

[Message](#) restricted to SOAP payload. This is a special [Message](#) intended to be used in language bindings for programming languages which are not flexible enough to support all kinds of Payloads. It is passed through chain of MCCs and works like the [Message](#) but can carry only SOAP content.

5.290.2 Constructor & Destructor Documentation

5.290.2.1 Arc::SOAPMessage::SOAPMessage (void) [inline]

Dummy constructor

5.290.2.2 Arc::SOAPMessage::SOAPMessage (long *msg_ptr_addr*)

Copy constructor. Used by language bindigs

5.290.2.3 Arc::SOAPMessage::SOAPMessage (Message & *msg*)

Copy constructor. Ensures shallow copy.

5.290.2.4 Arc::SOAPMessage::~SOAPMessage (void)

Destructor does not affect refered objects

5.290.3 Member Function Documentation

5.290.3.1 MessageAttributes* Arc::SOAPMessage::Attributes (void) [inline]

Returns a pointer to the current attributes object or NULL if no attributes object has been assigned.

5.290.3.2 void Arc::SOAPMessage::Payload (SOAPEnvelope * *new_payload*)

Replace payload with a COPY of new one

5.290.3.3 SOAPEnvelope* Arc::SOAPMessage::Payload (void)

Returns pointer to current payload or NULL if no payload assigned.

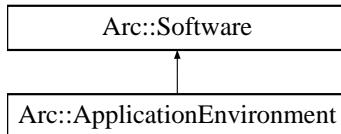

The documentation for this class was generated from the following file:

- SOAPMessage.h

5.291 Arc::Software Class Reference

Used to represent software (names and version) and comparison.

```
#include <Software.h>

5.291.1 Detailed Description

Used to represent software (names and version) and comparison. The [Software](#) class is used to represent the name of a piece of software internally. Generally software are identified by a name and possibly a version number. Some software can also be categorized by type or family (compilers, operating system, etc.). A software object can be compared to other software objects using the comparison operators contained in this class. The basic usage of this class is to test if some specified software requirement ([SoftwareRequirement](#)) are fulfilled, by using the comparability of the class.

Internally the [Software](#) object is represented by a family and name identifier, and the software version is tokenized at the characters defined in VERSIONTOKENS, and stored as a list of tokens.

5.291.2 Member Typedef Documentation

5.291.2.1 [typedef bool\(Software::* Arc::Software::ComparisonOperator\)\(const Software &\) const](#)

Definition of a comparison operator method pointer. This `typedef` defines a comparison operator method pointer.

See also:

[operator==](#),
[operator!=](#),
[operator>](#),
[operator<](#),
[operator>=](#),
[operator<=](#),
[ComparisonOperatorEnum](#).

5.291.3 Member Enumeration Documentation

5.291.3.1 [enum Arc::Software::ComparisonOperatorEnum](#)

Comparison operator enum. The [ComparisonOperatorEnum](#) enumeration is a 1-1 correspondence between the defined comparison method operators ([Software::ComparisonOperator](#)), and can be used in circumstances where method pointers are not supported.

Enumerator:

NOTEQUAL see [operator!=](#)
EQUAL see [operator==](#)
GREATERTHAN see [operator>](#)
LESSTHAN see [operator<](#)
GREATERTHANOREQUAL see [operator>=](#)
LESSTHANOREQUAL see [operator<=](#)

5.291.4 Constructor & Destructor Documentation

5.291.4.1 Arc::Software::Software () [inline]

Dummy constructor. This constructor creates a empty object.

5.291.4.2 Arc::Software::Software (const std::string & *name_version*)

Create a [Software](#) object. Create a [Software](#) object from a single string composed of a name and a version part. The created object will contain a empty family part. The name and version part of the string will be split at the first occurence of a dash (-) which is followed by a digit (0-9). If the string does not contain such a pattern, the passed string will be taken to be the name and version will be empty.

Parameters:

name_version should be a string composed of the name and version of the software to represent.

5.291.4.3 Arc::Software::Software (const std::string & *name*, const std::string & *version*)

Create a [Software](#) object. Create a [Software](#) object with the specified name and version. The family part will be left empty.

Parameters:

name the software name to represent.

version the software version to represent.

5.291.4.4 Arc::Software::Software (const std::string & *family*, const std::string & *name*, const std::string & *version*)

Create a [Software](#) object. Create a [Software](#) object with the specified family, name and version.

Parameters:

family the software family to represent.

name the software name to represent.

version the software version to represent.

5.291.5 Member Function Documentation

5.291.5.1 static ComparisonOperator Arc::Software::convert (const ComparisonOperatorEnum & *co*) [static]

Convert a [ComparisonOperatorEnum](#) value to a comparison method pointer. The passed [ComparisonOperatorEnum](#) will be converted to a comparison method pointer defined by the [Software::ComparisonOperator](#) typedef.

This static method is not defined in language bindings created with Swig, since method pointers are not supported by Swig.

Parameters:

co a ComparisonOperatorEnum value.

Returns:

A method pointer to a comparison method is returned.

5.291.5.2 bool Arc::Software::empty () const [inline]

Indicates whether the object is empty.

Returns:

true if the name of this object is empty, otherwise false.

5.291.5.3 const std::string& Arc::Software::getFamily () const [inline]

Get family.

Returns:

The family the represented software belongs to is returned.

5.291.5.4 const std::string& Arc::Software::getName () const [inline]

Get name.

Returns:

The name of the represented software is returned.

5.291.5.5 const std::string& Arc::Software::getVersion () const [inline]

Get version.

Returns:

The version of the represented software is returned.

5.291.5.6 Arc::Software::operator std::string (void) const [inline]

Cast to string. This casting operator behaves exactly as [operator\(\)\(\)](#) does. The cast is used like (std::string) <software-object>.

See also:

[operator\(\)\(\)](#).

References [operator\(\)\(\)](#).

5.291.5.7 bool Arc::Software::operator!= (const Software & sw) const [inline]

Inequality operator. The behaviour of the inequality operator is just opposite that of the equality operator ([operator==\(\)](#)).

Parameters:

sw is the RHS [Software](#) object.

Returns:

`true` when the two objects are unequal, otherwise `false`.

References [operator==\(\)](#).

5.291.5.8 std::string Arc::Software::operator() () const

Get string representation. Returns the string representation of this object, which is 'family'-'name'-'version'.

Returns:

The string representation of this object is returned.

See also:

[operator std::string\(\)](#).

Referenced by [operator std::string\(\)](#).

5.291.5.9 bool Arc::Software::operator< (const Software & sw) const [inline]

Less-than operator. The behaviour of this less-than operator is equivalent to the greater-than operator ([operator>\(\)](#)) with the LHS and RHS swapped.

Parameters:

sw is the RHS object.

Returns:

`true` if the LHS is less than the RHS, otherwise `false`.

See also:

[operator>\(\)](#).

5.291.5.10 bool Arc::Software::operator<= (const Software & sw) const [inline]

Less-than or equal operator. The LHS object is greater than or equal to the RHS object if the LHS equal the RHS ([operator==\(\)](#)) or if the LHS is greater than the RHS ([operator>\(\)](#)).

Parameters:

sw is the RHS object.

Returns:

true if the LHS is less than or equal the RHS, otherwise false.

See also:

[operator==\(\)](#),
[operator<\(\)](#).

5.291.5.11 bool Arc::Software::operator== (const Software & sw) const [inline]

Equality operator. Two [Software](#) objects are equal only if they are of the same family, have the same name and is of same version. This operator can also be represented by the [Software::EQUAL ComparisonOperatorEnum](#) value.

Parameters:

sw is the RHS [Software](#) object.

Returns:

true when the two objects equals, otherwise false.

Referenced by [operator!=\(\)](#).

5.291.5.12 bool Arc::Software::operator> (const Software & sw) const

Greater-than operator. For the LHS object to be greater than the RHS object they must first share the same family and name. If the version of the LHS is empty or the LHS and RHS versions equal then LHS is not greater than RHS. If the LHS version is not empty while the RHS is then LHS is greater than RHS. If both versions are non empty and not equal then, the first version token of each object is compared and if they are identical, the two next version tokens will be compared. If not identical, the two tokens will be parsed as integers, and if parsing fails the LHS is not greater than the RHS. If parsing succeeds and the integers equals, the two next tokens will be compared, otherwise the comparison is resolved by the integer comparison.

If the LHS contains more version tokens than the RHS, and the comparison have not been resolved at the point of equal number of tokens, then if the additional tokens contains a token which cannot be parsed to a integer the LHS is not greater than the RHS. If the parsed integer is not 0 then the LHS is greater than the RHS. If the rest of the additional tokens are 0, the LHS is not greater than the RHS.

If the RHS contains more version tokens than the LHS and comparison have not been resolved at the point of equal number of tokens, or simply if comparison have not been resolved at the point of equal number of tokens, then the LHS is not greater than the RHS.

Parameters:

sw is the RHS object.

Returns:

true if the LHS is greater than the RHS, otherwise false.

5.291.5.13 bool Arc::Software::operator>= (const Software & *sw*) const [inline]

Greater-than or equal operator. The LHS object is greater than or equal to the RHS object if the LHS equal the RHS ([operator==\(\)](#)) or if the LHS is greater than the RHS ([operator>\(\)](#)).

Parameters:

sw is the RHS object.

Returns:

`true` if the LHS is greater than or equal the RHS, otherwise `false`.

See also:

[operator==\(\)](#),
[operator>\(\)](#).

5.291.5.14 static std::string Arc::Software::toString (ComparisonOperator *co*) [static]

Convert [Software::ComparisonOperator](#) to a string. This method is not available in language bindings created by Swig, since method pointers are not supported by Swig.

Parameters:

co is a [Software::ComparisonOperator](#).

Returns:

The string representation of the passed [Software::ComparisonOperator](#) is returned.

5.291.6 Friends And Related Function Documentation

5.291.6.1 std::ostream& operator<< (std::ostream & *out*, const Software & *sw*) [friend]

Write [Software](#) string representation to a std::ostream. Write the string representation of a [Software](#) object to a std::ostream.

Parameters:

out is a std::ostream to write the string representation of the [Software](#) object to.

sw is the [Software](#) object to write to the std::ostream.

Returns:

The passed std::ostream *out* is returned.

5.291.7 Field Documentation

5.291.7.1 const std::string Arc::Software::VERSIONTOKENS [static]

Tokens used to split version string. This string constant specifies which tokens will be used to split the version string.

The documentation for this class was generated from the following file:

- Software.h

5.292 Arc::SoftwareRequirement Class Reference

Class used to express and resolve version requirements on software.

- `const std::list< Software::ComparisonOperator > & getComparisonOperatorList () const`

5.292.1 Detailed Description

Class used to express and resolve version requirements on software. A requirement in this class is defined as a pair composed of a `Software` object and either a `Software::ComparisonOperator` method pointer or equally a `Software::ComparisonOperatorEnum` enum value. A `SoftwareRequirement` object can contain multiple of such requirements, and then it can be specified if all these requirements should be satisfied, or if it is enough to satisfy only one of them. The requirements can be satisfied by a single `Software` object or a list of either `Software` or `ApplicationEnvironment` objects, by using the method `isSatisfied()`. This class also contains a number of methods (`selectSoftware()`) to select `Software` objects which are satisfying the requirements, and in this way resolving requirements.

5.292.2 Constructor & Destructor Documentation

5.292.2.1 Arc::SoftwareRequirement::SoftwareRequirement () [inline]

Create an empty `SoftwareRequirement` object. The created `SoftwareRequirement` object will contain no requirements.

5.292.2.2 Arc::SoftwareRequirement::SoftwareRequirement (const Software & *sw*, Software::ComparisonOperator *swComOp*)

Create a [SoftwareRequirement](#) object. The created [SoftwareRequirement](#) object will contain one requirement specified by the [Software](#) object *sw*, and the [Software::ComparisonOperator](#) *swComOp*.

This constructor is not available in language bindings created by Swig, since method pointers are not supported by Swig, see [SoftwareRequirement\(const Software&, Software::ComparisonOperatorEnum\)](#) instead.

Parameters:

sw is the [Software](#) object of the requirement to add.

swComOp is the [Software::ComparisonOperator](#) of the requirement to add.

5.292.2.3 Arc::SoftwareRequirement::SoftwareRequirement (const Software & *sw*, Software::ComparisonOperatorEnum *co* = Software::EQUAL)

Create a [SoftwareRequirement](#) object. The created [SoftwareRequirement](#) object will contain one requirement specified by the [Software](#) object *sw*, and the [Software::ComparisonOperatorEnum](#) *co*.

Parameters:

sw is the [Software](#) object of the requirement to add.

co is the [Software::ComparisonOperatorEnum](#) of the requirement to add.

5.292.2.4 Arc::SoftwareRequirement::SoftwareRequirement (const SoftwareRequirement & *sr*) [inline]

Copy constructor. Create a [SoftwareRequirement](#) object from another [SoftwareRequirement](#) object.

Parameters:

sr is the [SoftwareRequirement](#) object to make a copy of.

5.292.3 Member Function Documentation

5.292.3.1 void Arc::SoftwareRequirement::add (const Software & *sw*, Software::ComparisonOperatorEnum *co*)

Add a [Software](#) object a corresponding comparison operator to this object. Adds software name and version to list of requirements and associates the comparison operator with it (equality by default).

Parameters:

sw is the [Software](#) object to add as part of a requirement.

co is the [Software::ComparisonOperatorEnum](#) value to add as part of a requirement, the default enum will be [Software::EQUAL](#).

**5.292.3.2 void Arc::SoftwareRequirement::add (const Software & sw,
Software::ComparisonOperator swComOp)**

Add a [Software](#) object a corresponding comparison operator to this object. Adds software name and version to list of requirements and associates the comparison operator with it (equality by default).

This method is not available in language bindings created by Swig, since method pointers are not supported by Swig, see [add\(const Software&, Software::ComparisonOperatorEnum\)](#) instead.

Parameters:

sw is the [Software](#) object to add as part of a requirement.

swComOp is the [Software::ComparisonOperator](#) method pointer to add as part of a requirement, the default operator will be [Software::operator==\(\)](#).

5.292.3.3 void Arc::SoftwareRequirement::clear () [inline]

Clear the object. The requirements in this object will be cleared when invoking this method.

5.292.3.4 bool Arc::SoftwareRequirement::empty () const [inline]

Test if the object is empty.

Returns:

`true` if this object do no contain any requirements, otherwise `false`.

**5.292.3.5 const std::list<Software::ComparisonOperator>&
Arc::SoftwareRequirement::getComparisonOperatorList () const
[inline]**

Get list of comparison operators.

Returns:

The list of internally stored comparison operators is returned.

See also:

[Software::ComparisonOperator](#),
[getSoftwareList](#).

**5.292.3.6 const std::list<Software>& Arc::SoftwareRequirement::getSoftwareList () const
[inline]**

Get list of [Software](#) objects.

Returns:

The list of internally stored [Software](#) objects is returned.

See also:

[Software](#),
[getComparisonOperatorList](#).

5.292.3.7 bool Arc::SoftwareRequirement::isResolved () const

Indicates whether requirements have been resolved or not. If specified that only one requirement has to be satisfied, then for this object to be resolved it can only contain one requirement and it has to use the equal operator ([Software::operator==](#)).

If specified that all requirements have to be satisfied, then for this object to be resolved each requirement must have a [Software](#) object with a unique family/name composition, i.e. no other requirements have a [Software](#) object with the same family/name composition, and each requirement must use the equal operator ([Software::operator==](#)).

If this object has been resolved then `true` is returned when invoking this method, otherwise `false` is returned.

Returns:

`true` if this object have been resolved, otherwise `false`.

5.292.3.8 bool Arc::SoftwareRequirement::isSatisfied (const std::list< ApplicationEnvironment > & swList) const

Test if requirements are satisfied. This method behaves in exactly the same way as the [isSatisfied\(const Software&\) const](#) method does.

Parameters:

`swList` is the list of [ApplicationEnvironment](#) objects which should be used to try satisfy the requirements.

Returns:

`true` if requirements are satisfied, otherwise `false`.

See also:

[isSatisfied\(const Software&\) const](#),
[isSatisfied\(const std::list<Software>&\) const](#),
[selectSoftware\(const std::list<ApplicationEnvironment>&\)](#),
[isResolved\(\) const](#).

5.292.3.9 bool Arc::SoftwareRequirement::isSatisfied (const std::list< Software > & swList) const [inline]

Test if requirements are satisfied. Returns `true` if stored requirements are satisfied by software specified in `swList`, otherwise `false` is returned.

Note that if all requirements must be satisfied and multiple requirements exist having identical name and family all these requirements should be satisfied by a single [Software](#) object.

Parameters:

swList is the list of [Software](#) objects which should be used to try satisfy the requirements.

Returns:

`true` if requirements are satisfied, otherwise `false`.

See also:

[isSatisfied\(const Software&\)](#) const,
[isSatisfied\(const std::list<ApplicationEnvironment>&\)](#) const,
[selectSoftware\(const std::list<Software>&\)](#),
[isResolved\(\)](#) const.

5.292.3.10 bool Arc::SoftwareRequirement::isSatisfied (const Software & *sw*) const [inline]

Test if requirements are satisfied. Returns `true` if the requirements are satisfied by the specified [Software](#) *sw*, otherwise `false` is returned.

Parameters:

sw is the [Software](#) which should satisfy the requirements.

Returns:

`true` if requirements are satisfied, otherwise `false`.

See also:

[isSatisfied\(const std::list<Software>&\)](#) const,
[isSatisfied\(const std::list<ApplicationEnvironment>&\)](#) const,
[selectSoftware\(const Software&\)](#),
[isResolved\(\)](#) const.

References [isSatisfied\(\)](#).

Referenced by [isSatisfied\(\)](#).

5.292.3.11 SoftwareRequirement& Arc::SoftwareRequirement::operator= (const SoftwareRequirement & *sr*)

Assignment operator. Set this object equal to that of the passed [SoftwareRequirement](#) object *sr*.

Parameters:

sr is the [SoftwareRequirement](#) object to set object equal to.

5.292.3.12 bool Arc::SoftwareRequirement::selectSoftware (const std::list<ApplicationEnvironment > & *swList*)

Select software. This method behaves exactly as the [selectSoftware\(const std::list<Software>&\)](#) method does.

Parameters:

swList is a list of [ApplicationEnvironment](#) objects used to satisfy requirements.

Returns:

`true` if requirements are satisfied, otherwise `false`.

See also:

[selectSoftware\(const Software&\)](#),
[selectSoftware\(const std::list<Software>&\)](#),
[isSatisfied\(const std::list<ApplicationEnvironment>&\) const](#),
[isResolved\(\) const](#).

5.292.3.13 bool Arc::SoftwareRequirement::selectSoftware (const std::list< Software > & *swList*)

Select software. If the passed list of [Software](#) objects *swList* do not satisfy the requirements `false` is returned and this object is not modified. If however the list of [Software](#) objects *swList* do satisfy the requirements `true` is returned and the [Software](#) objects satisfying the requirements will replace these with the equality operator ([Software::operator==](#)) used as the comparator for the new requirements.

Note that if all requirements must be satisfied and multiple requirements exist having identical name and family all these requirements should be satisfied by a single [Software](#) object and it will replace all these requirements.

Parameters:

swList is a list of [Software](#) objects used to satisfy requirements.

Returns:

`true` if requirements are satisfied, otherwise `false`.

See also:

[selectSoftware\(const Software&\)](#),
[selectSoftware\(const std::list<ApplicationEnvironment>&\)](#),
[isSatisfied\(const std::list<Software>&\) const](#),
[isResolved\(\) const](#).

5.292.3.14 bool Arc::SoftwareRequirement::selectSoftware (const Software & *sw*) [inline]

Select software. If the passed [Software](#) *sw* do not satisfy the requirements `false` is returned and this object is not modified. If however the [Software](#) object *sw* do satisfy the requirements `true` is returned and the requirements are set to equal the *sw* [Software](#) object.

Parameters:

sw is the [Software](#) object used to satisfy requirements.

Returns:

`true` if requirements are satisfied, otherwise `false`.

See also:

[selectSoftware\(const std::list<Software>&\)](#),
[selectSoftware\(const std::list<ApplicationEnvironment>&\)](#),
[isSatisfied\(const Software&\) const](#),
[isResolved\(\) const](#).

5.293 ArcSec::Source Class Reference

Acquires and parses XML document from specified source.

#include <Source.h> Inheritance diagram for ArcSec::Source::

Public Member Functions

- `Source (const Source &s)`
- `Source (Arc::XMLNode xml)`
- `Source (std::istream &stream)`
- `Source (Arc::URL &url)`
- `Source (const std::string &str)`
- `Arc::XMLNode Get (void) const`
- `operator bool (void)`

5.293.1 Detailed Description

Acquires and parses XML document from specified source. This class is to be used to provide easy way to specify different sources for XML Authorization Policies and Requests.

5.293.2 Constructor & Destructor Documentation

5.293.2.1 ArcSec::Source::Source (const Source & s) [inline]

Copy constructor. Use this constructor only for temporary objects. Parsed XML document is still owned by copied source and hence lifetime of created object should not exceed that of copied one.

5.293.2.2 ArcSec::Source::Source (Arc::XMLNode xml)

Use XML subtree refered by `xml`. There is no copy of `xml` made. Hence lifetime of this object should not exceed that of `xml`.

5.293.2.3 ArcSec::Source::Source (Arc::URL & url)

Fetch XML document from specified url and parse it. This constructor is not implemented yet.

5.300 Arc::SubmitterPlugin Class Reference

Base class for the SubmitterPlugins.

```
#include <SubmitterPlugin.h>
```

Public Member Functions

- virtual bool [Submit](#) (const std::list< [JobDescription](#) > &jobdesc, const [ExecutionTarget](#) &et, [EntityConsumer< Job >](#) &jc, std::list< const [JobDescription](#) * > ¬Submitted)=0
- virtual bool [Migrate](#) (const [URL](#) &jobid, const [JobDescription](#) &jobdesc, const [ExecutionTarget](#) &et, bool forcemigration, [Job](#) &job)

5.300.1 Detailed Description

Base class for the SubmitterPlugins. [SubmitterPlugin](#) is the base class for Grid middleware specialized [SubmitterPlugin](#) objects. The class submits job(s) to the computing resource it represents and uploads (needed by the job) local input files.

5.300.2 Member Function Documentation

5.300.2.1 virtual bool Arc::SubmitterPlugin::Migrate (const URL & jobid, const JobDescription & jobdesc, const ExecutionTarget & et, bool forcemigration, Job & job) [virtual]

Migrate job. This virtual method should be overridden by plugins which should be capable of migrating jobs. The active job which should be migrated is pointed to by the [URL](#) jobid, and is represented by the [JobDescription](#) jobdesc. The forcemigration boolean specifies if the migration should succeed if the active job cannot be terminated. The protected method AddJob can be used to save job information. This method should return the [URL](#) of the migrated job. In case migration fails an empty [URL](#) should be returned.

5.300.2.2 virtual bool Arc::SubmitterPlugin::Submit (const std::list< JobDescription > & jobdesc, const ExecutionTarget & et, EntityConsumer< Job > & jc, std::list< const JobDescription * > & notSubmitted) [pure virtual]

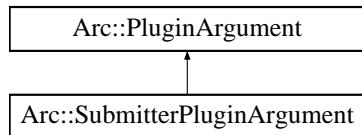

Submit job. This virtual method should be overridden by plugins which should be capable of submitting jobs, defined in the [JobDescription](#) jobdesc, to the [ExecutionTarget](#) et. The protected convenience method AddJob can be used to save job information. This method should return the [URL](#) of the submitted job. In case submission fails an empty [URL](#) should be returned.

- [SubmitterPlugin * load \(const std::string &name, const UserConfig &usercfg\)](#)

5.302.1 Detailed Description

Class responsible for loading [SubmitterPlugin](#) plugins. The [SubmitterPlugin](#) objects returned by a [SubmitterPluginLoader](#) must not be used after the [SubmitterPluginLoader](#) goes out of scope.

5.302.2 Constructor & Destructor Documentation

5.302.2.1 Arc::SubmitterPluginLoader::SubmitterPluginLoader ()

Constructor Creates a new [SubmitterPluginLoader](#).

5.302.2.2 Arc::SubmitterPluginLoader::~SubmitterPluginLoader ()

Destructor Calling the destructor destroys all [SubmitterPlugins](#) loaded by the [SubmitterPluginLoader](#) instance.

5.302.3 Member Function Documentation

5.302.3.1 SubmitterPlugin* Arc::SubmitterPluginLoader::load (const std::string & name, const UserConfig & usercfg)

Load a new [SubmitterPlugin](#)

Parameters:

- name* The name of the [SubmitterPlugin](#) to load.
- usercfg* The [UserConfig](#) object for the new [SubmitterPlugin](#).

Returns:

A pointer to the new [SubmitterPlugin](#) (NULL on error).

5.307 Arc::ThreadDataItem Class Reference

Base class for per-thread object.

```
#include <Thread.h>
```

Public Member Functions

- `ThreadDataItem (void)`
- `ThreadDataItem (std::string &key)`
- `ThreadDataItem (const std::string &key)`
- `void Attach (std::string &key)`
- `void Attach (const std::string &key)`
- `virtual void Dup (void)`

Static Public Member Functions

- static `ThreadDataItem * Get (const std::string &key)`

5.307.1 Detailed Description

Base class for per-thread object. Classes inherited from this one are attached to current thread under specified key and destroyed only when thread ends or object is replaced by another one with same key.

5.307.2 Constructor & Destructor Documentation

5.307.2.1 Arc::ThreadDataItem::ThreadDataItem (void)

Dummy constructor which does nothing. To make object usable one of Attach(...) methods must be used.

5.307.2.2 Arc::ThreadDataItem::ThreadDataItem (std::string &key)

Creates instance and attaches it to current thread under key. If supplied key is empty random one is generated and stored in key variable.

5.307.2.3 Arc::ThreadDataItem::ThreadDataItem (const std::string &key)

Creates instance and attaches it to current thread under key.

5.307.3 Member Function Documentation

5.307.3.1 void Arc::ThreadDataItem::Attach (const std::string &key)

Attaches object to current thread under key. This method must be used only if object was created using dummy constructor.

5.307.3.2 void Arc::ThreadDataItem::Attach (std::string & *key*)

Attaches object to current thread under key. If supplied key is empty random one is generated and stored in key variable. This method must be used only if object was created using dummy constructor.

5.307.3.3 virtual void Arc::ThreadDataItem::Dup (void) [virtual]

Creates copy of object. This method is called when new thread is created from current thread. It is called in new thread, so new object - if created - gets attached to new thread. If object is not meant to be inherited by new threads then this method should do nothing.

5.307.3.4 static ThreadDataItem* Arc::ThreadDataItem::Get (const std::string & *key*) [static]

Retrieves object attached to thread under key. Returns NULL if no such obejct.

The documentation for this class was generated from the following file:

- Thread.h

5.308 Arc::ThreadedPointer< T > Class Template Reference

Wrapper for pointer with automatic destruction and mutiple references.

```
#include <Thread.h>
```

Public Member Functions

- `T & operator*` (void) const
- `T * operator->` (void) const
- `operator bool` (void) const
- `bool operator!` (void) const
- `bool operator==(const ThreadedPointer &p)` const
- `bool operator!= (const ThreadedPointer &p)` const
- `bool operator< (const ThreadedPointer &p)` const
- `T * Ptr` (void) const
- `T * Release` (void)
- `unsigned int Holders` (void)
- `unsigned int WaitOutRange` (`unsigned int minThr, unsigned int maxThr`)
- `unsigned int WaitOutRange` (`unsigned int minThr, unsigned int maxThr, int timeout`)
- `unsigned int WaitInRange` (`unsigned int minThr, unsigned int maxThr`)
- `unsigned int WaitInRange` (`unsigned int minThr, unsigned int maxThr, int timeout`)

5.308.1 Detailed Description

`template<typename T> class Arc::ThreadedPointer< T >`

Wrapper for pointer with automatic destruction and mutiple references. See for [CountedPointer](#) for description. Differently from [CountedPointer](#) this class provides thread safe destruction of refered object. But the instance of [ThreadedPointer](#) itself is not thread safe. Hence it is advisable to use different instances in different threads.

5.308.2 Member Function Documentation

5.308.2.1 `template<typename T> T* Arc::ThreadedPointer< T >::Release (void) [inline]`

Release refered object so that it can be passed to other container. After `Release()` is called refered object is will not be destroyed automatically anymore.

5.308.2.2 `template<typename T> unsigned int Arc::ThreadedPointer< T >::WaitInRange (unsigned int minThr, unsigned int maxThr, int timeout) [inline]`

Waits till number of [ThreadedPointer](#) instances \geq minThr and \leq maxThr. Waits no longer than timeout milliseconds. If timeout is negative - wait forever. Returns current number of instances.

**5.308.2.3 template<typename T> unsigned int Arc::ThreadedPointer< T >::WaitOutRange
(unsigned int *minThr*, unsigned int *maxThr*, int *timeout*) [inline]**

Waits till number of [ThreadedPointer](#) instances \leq minThr or \geq maxThr. Waits no longer than timeout milliseconds. If timeout is negative - wait forever. Returns current number of instances.

The documentation for this class was generated from the following file:

- Thread.h

5.309 Arc::ThreadedPointerBase Class Reference

Helper class for [ThreadedPointer](#).

```
#include <Thread.h>
```

5.309.1 Detailed Description

Helper class for [ThreadedPointer](#).

The documentation for this class was generated from the following file:

- Thread.h

5.310 Arc::ThreadInitializer Class Reference

The documentation for this class was generated from the following file:

- Thread.h

5.311 Arc::ThreadRegistry Class Reference

```
#include <Thread.h>
```

Public Member Functions

- void [RegisterThread](#) (void)
- void [UnregisterThread](#) (void)
- bool [WaitOrCancel](#) (int timeout)
- bool [WaitForExit](#) (int timeout=-1)

5.311.1 Detailed Description

This class is a set of conditions, mutexes, etc. conveniently exposed to monitor running child threads and to wait till they exit. There are no protections against race conditions. So use it carefully.

5.311.2 Member Function Documentation

5.311.2.1 bool Arc::ThreadRegistry::WaitForExit (int *timeout* = -1)

Wait for registered threads to exit. Leave after timeout miliseconds if failed. Returns true if all registered threads reported their exit.

5.311.2.2 bool Arc::ThreadRegistry::WaitOrCancel (int *timeout*)

Wait for timeout milliseconds or cancel request. Returns true if cancel request received.

The documentation for this class was generated from the following file:

- Thread.h

5.312 Arc::Time Class Reference

A class for storing and manipulating times.

```
#include <DateTime.h>
```

Public Member Functions

- `Time ()`
- `Time (time_t)`
- `Time (time_t time, uint32_t nanosec)`
- `Time (const std::string &)`
- `Time & operator= (time_t)`
- `Time & operator= (const Time &)`
- `Time & operator= (const char *)`
- `Time & operator= (const std::string &)`
- `void SetTime (time_t)`
- `void SetTime (time_t time, uint32_t nanosec)`
- `time_t GetTime () const`
- `operator std::string () const`
- `std::string str (const TimeFormat &=time_format) const`
- `bool operator< (const Time &) const`
- `bool operator> (const Time &) const`
- `bool operator<= (const Time &) const`
- `bool operator>= (const Time &) const`
- `bool operator== (const Time &) const`
- `bool operator!= (const Time &) const`
- `Time operator+ (const Period &) const`
- `Time operator- (const Period &) const`
- `Period operator- (const Time &) const`

Static Public Member Functions

- `static void SetFormat (const TimeFormat &)`
- `static TimeFormat GetFormat ()`

5.312.1 Detailed Description

A class for storing and manipulating times.

5.312.2 Constructor & Destructor Documentation

5.312.2.1 Arc::Time::Time()

Default constructor. The time is put equal the current time.

5.312.2.2 Arc::Time::Time (time_t)

Constructor that takes a time_t variable and stores it.

5.312.2.3 Arc::Time::Time (time_t *time*, uint32_t *nanosec*)

Constructor that takes a fine grained time variables and stores them.

5.312.2.4 Arc::Time::Time (const std::string &)

Constructor that tries to convert a string into a time_t.

5.312.3 Member Function Documentation**5.312.3.1 static TimeFormat Arc::Time::GetFormat () [static]**

Gets the default format for time strings.

5.312.3.2 time_t Arc::Time::GetTime () const

gets the time

5.312.3.3 Arc::Time::operator std::string () const

Returns a string representation of the time, using the default format.

5.312.3.4 bool Arc::Time::operator!= (const Time &) const

Comparing two [Time](#) objects.

5.312.3.5 Time Arc::Time::operator+ (const Period &) const

Adding [Time](#) object with [Period](#) object.

5.312.3.6 Period Arc::Time::operator- (const Time &) const

Subtracting [Time](#) object from the other [Time](#) object.

5.312.3.7 Time Arc::Time::operator- (const Period &) const

Subtracting [Period](#) object from [Time](#) object.

5.312.3.8 bool Arc::Time::operator< (const Time &) const

Comparing two [Time](#) objects.

5.312.3.9 bool Arc::Time::operator<= (const Time &) const

Comparing two [Time](#) objects.

5.312.3.10 Time& Arc::Time::operator= (const std::string &)

Assignment operator from a string.

5.312.3.11 Time& Arc::Time::operator= (const char *)

Assignment operator from a char pointer.

5.312.3.12 Time& Arc::Time::operator= (const Time &)

Assignment operator from a [Time](#).

5.312.3.13 Time& Arc::Time::operator= (time_t)

Assignment operator from a time_t.

5.312.3.14 bool Arc::Time::operator== (const Time &) const

Comparing two [Time](#) objects.

5.312.3.15 bool Arc::Time::operator> (const Time &) const

Comparing two [Time](#) objects.

5.312.3.16 bool Arc::Time::operator>= (const Time &) const

Comparing two [Time](#) objects.

5.312.3.17 static void Arc::Time::SetFormat (const TimeFormat &) [static]

Sets the default format for time strings.

5.312.3.18 void Arc::Time::SetTime (time_t time, uint32_t nanosec)

sets the fine grained time

5.312.3.19 void Arc::Time::SetTime (time_t)

sets the time

Referenced by DataStaging::DTR::set_timeout().

5.312.3.20 std::string Arc::Time::str (const TimeFormat & = time_format) const

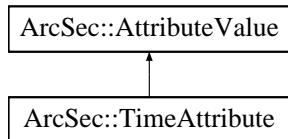

Returns a string representation of the time, using the specified format.

The documentation for this class was generated from the following file:

- DateTime.h

5.313 ArcSec::TimeAttribute Class Reference

#include <DateTimeAttribute.h> Inheritance diagram for ArcSec::TimeAttribute:

Public Member Functions

- virtual std::string [encode\(\)](#)
- virtual std::string [getType\(\)](#)
- virtual std::string [getId\(\)](#)

5.313.1 Detailed Description

Format: HHMMSSZ HH:MM:SS HH:MM:SS+HH:MM HH:MM:SSZ

5.313.2 Member Function Documentation

5.313.2.1 virtual std::string ArcSec::TimeAttribute::encode() [virtual]

encode the value in a string format

Implements [ArcSec::AttributeValue](#).

5.313.2.2 virtual std::string ArcSec::TimeAttribute::getId() [inline, virtual]

Get the AttributeId of the <Attribute>

Implements [ArcSec::AttributeValue](#).

5.313.2.3 virtual std::string ArcSec::TimeAttribute::getType() [inline, virtual]

Get the DataType of the <Attribute>

Implements [ArcSec::AttributeValue](#).

The documentation for this class was generated from the following file:

- [DateTimeAttribute.h](#)

5.314 Arc::TimedMutex Class Reference

The documentation for this class was generated from the following file:

- Thread.h

5.315 DataStaging::TransferParameters Class Reference

```
#include <DTR.h>
```

Public Member Functions

- [TransferParameters \(\)](#)

Data Fields

- `unsigned long long int min_average_bandwidth`
- `unsigned int max_inactivity_time`
- `unsigned long long int min_current_bandwidth`
- `unsigned int averaging_time`

5.315.1 Detailed Description

Represents limits and properties of a [DTR](#) transfer. These generally apply to all DTRs.

5.315.2 Field Documentation

5.315.2.1 `unsigned int DataStaging::TransferParameters::max_inactivity_time`

Maximum inactivity time in sec - if transfer stops for longer than this time it should be killed

5.315.2.2 `unsigned long long int DataStaging::TransferParameters::min_average_bandwidth`

Minimum average bandwidth in bytes/sec - if the average bandwidth used drops below this level the transfer should be killed

5.315.2.3 `unsigned long long int DataStaging::TransferParameters::min_current_bandwidth`

Minimum current bandwidth - if bandwidth averaged over averaging_time is less than minimum the transfer should be killed (allows transfers which slow down to be killed quicker)

The documentation for this class was generated from the following file:

- `DTR.h`

5.316 DataStaging::TransferShares Class Reference

[TransferShares](#) is used to implement fair-sharing and priorities.

```
#include <TransferShares.h>
```

Public Member Functions

- [TransferShares \(\)](#)
- [TransferShares \(const TransferSharesConf &shares_conf\)](#)
- [~TransferShares \(\)](#)
- [TransferShares \(const TransferShares &shares\)](#)
- [TransferShares & operator= \(const TransferShares &shares\)](#)
- [void set_shares_conf \(const TransferSharesConf &share_conf\)](#)
- [void calculate_shares \(int TotalNumberOfSlots\)](#)
- [void increase_transfer_share \(const std::string &ShareToIncrease\)](#)
- [void decrease_transfer_share \(const std::string &ShareToDecrease\)](#)
- [void decrease_number_of_slots \(const std::string &ShareToDecrease\)](#)
- [bool can_start \(const std::string &ShareToStart\)](#)
- [std::map< std::string, int > active_shares \(\) const](#)

5.316.1 Detailed Description

[TransferShares](#) is used to implement fair-sharing and priorities. [TransferShares](#) defines the algorithm used to prioritise and share transfers among different users or groups. Configuration information on the share type and reference shares is held in a [TransferSharesConf](#) instance. The [Scheduler](#) uses [TransferShares](#) to determine which DTRs in the queue for each process go first. The calculation is based on the configuration and the currently active shares (the DTRs already in the process). [can_start\(\)](#) is the method called by the [Scheduler](#) to determine whether a particular share has an available slot in the process.

5.316.2 Member Function Documentation

5.316.2.1 void DataStaging::TransferShares::calculate_shares (int *TotalNumberOfSlots*)

Calculate how many slots to assign to each active share. This method is called each time the [Scheduler](#) loops to calculate the number of slots to assign to each share, based on the current number of active shares and the shares' relative priorities.

5.316.2.2 void DataStaging::TransferShares::decrease_number_of_slots (const std::string & *ShareToDecrease*)

Decrease by one the number of slots available to the given share. Called when there is a slot already used by this share to reduce the number available.

5.316.2.3 void DataStaging::TransferShares::decrease_transfer_share (const std::string & *ShareToDecrease*)

Decrease by one the active count for the given share. Called when a completed [DTR](#) leaves the queue.

5.316.2.4 void DataStaging::TransferShares::increase_transfer_share (const std::string & *ShareToIncrease*)

Increase by one the active count for the given share. Called when a new [DTR](#) enters the queue.

The documentation for this class was generated from the following file:

- TransferShares.h

5.317 DataStaging::TransferSharesConf Class Reference

`TransferSharesConf` describes the configuration of `TransferShares`.

```
#include <TransferShares.h>
```

Public Types

- enum `ShareType` {

 `USER`, `VO`, `GROUP`, `ROLE`,

 `NONE` }

Public Member Functions

- `TransferSharesConf` (const std::string &type, const std::map< std::string, int > &ref_shares)
- `TransferSharesConf` ()
- void `set_share_type` (const std::string &type)
- void `set_reference_share` (const std::string &RefShare, int Priority)
- void `set_reference_shares` (const std::map< std::string, int > &shares)
- bool `is_configured` (const std::string &ShareToCheck)
- int `get_basic_priority` (const std::string &ShareToCheck)
- std::string `conf` () const
- std::string `extract_share_info` (DTR_ptr DTRToExtract)

5.317.1 Detailed Description

`TransferSharesConf` describes the configuration of `TransferShares`. It allows reference shares to be defined with certain priorities. An instance of this class is used when creating a `TransferShares` object.

5.317.2 Member Enumeration Documentation

5.317.2.1 enum DataStaging::TransferSharesConf::ShareType

The criterion for assigning a share to a `DTR`.

Enumerator:

- `USER`** Shares are defined per DN of the user's proxy.
- `VO`** Shares are defined per VOMS VO of the user's proxy.
- `GROUP`** Shares are defined per VOMS group of the user's proxy.
- `ROLE`** Shares are defined per VOMS role of the user's proxy.
- `NONE`** No share criterion - all DTRs will be assigned to a single share.

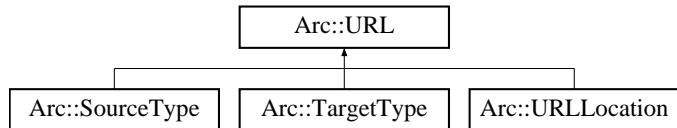

The documentation for this class was generated from the following file:

- TransferShares.h

5.318 Arc::URL Class Reference

Class to hold general URLs.

```
#include <URL.h>
```

Public Types

5.318.1 Detailed Description

Class to hold general URLs. The URL is split into protocol, hostname, port and path. This class tries to follow RFC 3986 for splitting URLs, at least for protocol + host part. It also accepts local file paths which are converted to file:path. The usual system dependent file paths are supported. Relative paths are converted to absolute paths by prepending them with current working directory path. A file path can't start from # symbol. If the string representation of URL starts from '@' then it is treated as path to a file containing a list of URLs.

A URL is parsed in the following way:

```
[protocol:][//[username:passwd@][[host][:port]][;urloptions[;...]][/path[?httpoption[&...]][:metadataoption[;...]]]]
```

The 'protocol' and 'host' parts are treated as case-insensitive and to avoid confusion are converted to lowercase in constructor. Note that 'path' is always converted to absolute path in constructor. The meaning of 'absolute' may depend upon URL type. For generic URL and local POSIX file paths that means path starts from / like

/path/to/file

For Windows paths absolute path may look like

C:\path\to\file

It is important to note that path still can be empty. For referencing local file using absolute path on POSIX filesystem one may use either

`file:///path/to/file` or `file:/path/to/file`

Relative path will look like

`file:to/file`

For local Windows files possible URLs are

`file:C:\path\to\file` or `file:to\file`

URLs representing LDAP resources have different structure of options following 'path' part:

`ldap://host[:port][;urloptions[;...]][/path[?attributes[?scope[?filter]]]]]`

For LDAP URLs paths are converted from /key1=value1.../keyN=valueN notation to keyN=valueN,...,key1=value1 and hence path does not contain leading /. If LDAP URL initially had path in second notation leading / is treated as separator only and is stripped.

URLs of indexing services optionally may have locations specified before 'host' part

`protocol://[location[,location[;...]]@][[host]][:port]...`

The structure of 'location' element is protocol specific.

5.318.2 Member Enumeration Documentation

5.318.2.1 enum Arc::URL::Scope

Scope for LDAP URLs

5.318.3 Constructor & Destructor Documentation

5.318.3.1 Arc::URL::URL ()

Empty constructor. Necessary when the class is part of another class and the like.

5.318.3.2 Arc::URL::URL (const std::string & *url*)

Constructs a new [URL](#) from a string representation.

5.318.3.3 virtual Arc::URL::~URL () [virtual]

[URL](#) Destructor

5.318.4 Member Function Documentation

5.318.4.1 bool Arc::URL::AddHTTPOption (const std::string & *option*, const std::string & *value*, bool *overwrite* = **true**)

Adds a HTP option with the given value. Returns false if overwrite is false and option already exists, true otherwise.

5.318.4.2 void Arc::URL::AddLDAPAttribute (const std::string & *attribute*)

Adds an LDAP attribute.

5.318.4.3 void Arc::URL::AddLocation (const URLLocation & *location*)

Adds a Location

5.318.4.4 void Arc::URL::AddMetaDataOption (const std::string & *option*, const std::string & *value*, bool *overwrite* = **true**)

Adds a metadata option

5.318.4.5 bool Arc::URL::AddOption (const std::string & *option*, bool *overwrite* = **true**)

Adds a [URL](#) option where option has the format "name=value". Returns false if overwrite is true and option already exists or if option does not have the correct format. Returns true otherwise.

5.318.4.6 bool Arc::URL::AddOption (const std::string & *option*, const std::string & *value*, bool *overwrite* = **true**)

Adds a [URL](#) option with the given value. Returns false if overwrite is false and option already exists, true otherwise. Note that some compilers may interpret AddOption("name", "value") as a call to AddOption(string, bool) so it is recommended to use explicit string types when calling this method.

5.318.4.7 static std::string Arc::URL::BaseDN2Path (const std::string &) [static, protected]

a private method that converts an ldap basedn to a path.

5.318.4.8 void Arc::URL::ChangeFullPath (const std::string & *newpath*)

Changes the path of the [URL](#) and all options attached.

5.318.4.9 void Arc::URL::ChangeHost (const std::string & *newhost*)

Changes the hostname of the [URL](#).

5.318.4.10 void Arc::URL::ChangeLDAPFilter (const std::string & *newfilter*)

Changes the LDAP filter.

5.318.4.11 void Arc::URL::ChangeLDAPScope (const Scope *newscope*)

Changes the LDAP scope.

5.318.4.12 void Arc::URL::ChangePath (const std::string & *newpath*)

Changes the path of the [URL](#).

5.318.4.13 void Arc::URL::ChangePort (int *newport*)

Changes the port of the [URL](#).

5.318.4.14 void Arc::URL::ChangeProtocol (const std::string & *newprot*)

Changes the protocol of the [URL](#).

5.318.4.15 const std::string& Arc::URL::CommonLocOption (const std::string & *option*, const std::string & *undefined* = "") const

Returns the value of a common location option.

Parameters:

option The option whose value is returned.

undefined This value is returned if the common location option is not defined.

5.318.4.16 const std::map<std::string, std::string>& Arc::URL::CommonLocOptions () const

Returns the common location options if any.

5.318.4.17 virtual std::string Arc::URL::ConnectionURL () const [virtual]

Returns a string representation with protocol, host and port only

5.318.4.18 std::string Arc::URL::FullPath () const

Returns the path of the [URL](#) with all options attached.

5.318.4.19 std::string Arc::URL::FullPathURIEncoded () const

Returns the path and all options, URI-encoded according to RFC 3986. Forward slashes ('/') in the path are not encoded but are encoded in the options.

5.318.4.20 virtual std::string Arc::URL::fullstr () const [virtual]

Returns a string representation including options and locations

Reimplemented in [Arc::URLLocation](#).

5.318.4.21 const std::string& Arc::URL::Host () const

Returns the hostname of the [URL](#).

5.318.4.22 const std::string& Arc::URL::HTTPOption (const std::string & *option*, const std::string & *undefined* = "") const

Returns the value of an HTTP option.

Parameters:

option The option whose value is returned.

undefined This value is returned if the HTTP option is not defined.

5.318.4.23 const std::map<std::string, std::string>& Arc::URL::HTTPOptions () const

Returns HTTP options if any.

5.318.4.24 bool Arc::URL::IsSecureProtocol () const

Indicates whether the protocol is secure or not.

5.318.4.25 const std::list<std::string>& Arc::URL::LDAPAttributes () const

Returns the LDAP attributes if any.

5.318.4.26 const std::string& Arc::URL::LDAPFilter () const

Returns the LDAP filter.

5.318.4.27 Scope Arc::URL::LDAPScope () const

Returns the LDAP scope.

5.318.4.28 const std::list<URLLocation>& Arc::URL::Locations () const

Returns the locations if any.

5.318.4.29 const std::string& Arc::URL::MetaDataOption (const std::string & *option*, const std::string & *undefined* = "") const

Returns the value of a metadata option.

Parameters:

option The option whose value is returned.

undefined This value is returned if the metadata option is not defined.

5.318.4.30 const std::map<std::string, std::string>& Arc::URL::MetaDataOptions () const

Returns metadata options if any.

5.318.4.31 Arc::URL::operator bool () const

Check if instance holds valid [URL](#)

5.318.4.32 bool Arc::URL::operator< (const URL & *url*) const

Compares one [URL](#) to another

5.318.4.33 bool Arc::URL::operator== (const URL & *url*) const

Is one [URL](#) equal to another?

5.318.4.34 const std::string& Arc::URL::Option (const std::string & *option*, const std::string & *undefined* = "") const

Returns the value of a [URL](#) option.

Parameters:

option The option whose value is returned.

undefined This value is returned if the [URL](#) option is not defined.

5.318.4.35 const std::map<std::string, std::string>& Arc::URL::Options () const

Returns [URL](#) options if any.

5.318.4.36 static std::string Arc::URL::OptionString (const std::map< std::string, std::string > & options, char separator) [static]

Returns a string representation of the options given in the options map

5.318.4.37 std::map<std::string, std::string> Arc::URL::ParseOptions (const std::string & optstring, char separator)

Parse a string of options separated by separator into an attribute->value map

5.318.4.38 void Arc::URL::ParsePath (void) [protected]

Convenience method for splitting schema specific part into path and options

5.318.4.39 const std::string& Arc::URL::Passwd () const

Returns the password of the [URL](#).

5.318.4.40 const std::string& Arc::URL::Path () const

Returns the path of the [URL](#).

5.318.4.41 static std::string Arc::URL::Path2BaseDN (const std::string &) [static, protected]

a private method that converts an ldap path to a basedn.

5.318.4.42 virtual std::string Arc::URL::plainstr () const [virtual]

Returns a string representation of the [URL](#) without any options

5.318.4.43 int Arc::URL::Port () const

Returns the port of the [URL](#).

5.318.4.44 const std::string& Arc::URL::Protocol () const

Returns the protocol of the [URL](#).

5.318.4.45 void Arc::URL::RemoveHTTPOption (const std::string & option)

Removes a HTTP option if exists.

Parameters:

option The option to remove.

5.318.4.46 void Arc::URL::RemoveMetaDataTable (const std::string & *option*)

Remove a metadata option if exists.

Parameters:

option The option to remove.

5.318.4.47 void Arc::URL::RemoveOption (const std::string & *option*)

Removes a [URL](#) option if exists.

Parameters:

option The option to remove.

5.318.4.48 virtual std::string Arc::URL::str () const [virtual]

Returns a string representation of the [URL](#) including meta-options.

Reimplemented in [Arc::URLLocation](#).

5.318.4.49 const std::string& Arc::URL::Username () const

Returns the username of the [URL](#).

5.318.5 Friends And Related Function Documentation

5.318.5.1 std::ostream& operator<< (std::ostream & *out*, const URL & *u*) [friend]

Overloaded operator << to print a [URL](#).

5.318.6 Field Documentation

5.318.6.1 std::map<std::string, std::string> Arc::URL::commonlocoptions [protected]

common location options for index server URLs.

5.318.6.2 std::string Arc::URL::host [protected]

hostname of the url.

5.318.6.3 std::map<std::string, std::string> Arc::URL::httpoptions [protected]

HTTP options of the url.

5.318.6.4 bool Arc::URL::ip6addr [protected]

if host is IPv6 numerical address notation.

5.318.6.5 std::list<std::string> Arc::URL::ldapattributes [protected]

LDAP attributes of the url.

5.318.6.6 std::string Arc::URL::ldapfilter [protected]

LDAP filter of the url.

5.318.6.7 Scope Arc::URL::ldapscope [protected]

LDAP scope of the url.

5.318.6.8 std::list<URLLocation> Arc::URL::locations [protected]

locations for index server URLs.

5.318.6.9 std::map<std::string, std::string> Arc::URL::metadataoptions [protected]

Meta data options

5.318.6.10 std::string Arc::URL::passwd [protected]

password of the url.

5.318.6.11 std::string Arc::URL::path [protected]

the url path.

5.318.6.12 int Arc::URL::port [protected]

portnumber of the url.

5.318.6.13 std::string Arc::URL::protocol [protected]

the url protocol.

5.318.6.14 std::map<std::string, std::string> Arc::URL::urloptions [protected]

options of the url.

5.318.6.15 std::string Arc::URL::username [protected]

username of the url.

5.318.6.16 bool Arc::URL::valid [protected]

flag to describe validity of [URL](#)

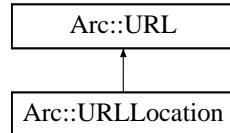

The documentation for this class was generated from the following file:

- URL.h

5.319 Arc::URLLocation Class Reference

Class to hold a resolved [URL](#) location.

```
#include <URL.h>
```

Public Member Functions

- [URLLocation \(const std::string &url=""\)](#)
- [URLLocation \(const std::string &url, const std::string &name\)](#)
- [URLLocation \(const URL &url\)](#)
- [URLLocation \(const URL &url, const std::string &name\)](#)

5.319.1 Detailed Description

Class to hold a resolved [URL](#) location. It is specific to file indexing service registrations.

5.319.2 Constructor & Destructor Documentation

5.319.2.1 Arc::URLLocation::URLLocation (const std::string & url = " ")

Creates a [URLLocation](#) from a string representaion.

5.319.2.2 Arc::URLLocation::URLLocation (const std::string & url, const std::string & name)

Creates a [URLLocation](#) from a string representaion and a name.

5.319.2.3 Arc::URLLocation::URLLocation (const URL & url)

Creates a [URLLocation](#) from a [URL](#).

5.319.2.4 Arc::URLLocation::URLLocation (const URL & *url*, const std::string & *name*)

Creates a [URLLocation](#) from a [URL](#) and a name.

5.319.2.5 Arc::URLLocation::URLLocation (const std::map< std::string, std::string > & *options*, const std::string & *name*)

Creates a [URLLocation](#) from options and a name.

5.319.2.6 virtual Arc::URLLocation::~URLLocation () [virtual]

[URLLocation](#) destructor.

5.319.3 Member Function Documentation

5.319.3.1 virtual std::string Arc::URLLocation::fullstr () const [virtual]

Returns a string representation including options and locations

Reimplemented from [Arc::URL](#).

5.319.3.2 const std::string& Arc::URLLocation::Name () const

Returns the [URLLocation](#) name.

5.319.3.3 virtual std::string Arc::URLLocation::str () const [virtual]

Returns a string representation of the [URLLocation](#).

Reimplemented from [Arc::URL](#).

5.319.4 Field Documentation

5.319.4.1 std::string Arc::URLLocation::name [protected]

the [URLLocation](#) name as registered in the indexing service.

5.321.1 Detailed Description

User configuration class This class provides a container for a selection of various attributes/parameters which can be configured to needs of the user, and can be read by implementing instances or programs. The class can be used in two ways. One can create a object from a configuration file, or simply set the desired attributes by using the setter method, associated with every setable attribute. The list of attributes which can be configured in this class are:

- certificatepath / **CertificatePath**(const std::string&)
- keypath / **KeyPath**(const std::string&)
- proxypath / **ProxyPath**(const std::string&)
- cacertificatesdirectory / **CACertificatesDirectory**(const std::string&)
- cacertificatepath / **CACertificatePath**(const std::string&)
- timeout / **Timeout**(int)
- joblist / **JobListFile**(const std::string&)
- verbosity / **Verbosity**(const std::string&)

- brokername / [Broker\(const std::string&\)](#) or [Broker\(const std::string&, const std::string&\)](#)
- brokerarguments / [Broker\(const std::string&\)](#) or [Broker\(const std::string&, const std::string&\)](#)
- bartender / [Bartender\(const std::list<URL>&\)](#)
- vomsserverpath / [VOMSESPath\(const std::string&\)](#)
- username / [UserName\(const std::string&\)](#)
- password / [Password\(const std::string&\)](#)
- keypassword / [KeyPassword\(const std::string&\)](#)
- keysize / [KeySize\(int\)](#)
- certificatelifetime / [CertificateLifeTime\(const Period&\)](#)
- slcs / [SLCS\(const URL&\)](#)
- storedirectory / [StoreDirectory\(const std::string&\)](#)
- jobdownloaddirectory / [JobDownloadDirectory\(const std::string&\)](#)
- idpname / [IdPName\(const std::string&\)](#)

where the first term is the name of the attribute used in the configuration file, and the second term is the associated setter method (for more information about a given attribute see the description of the setter method).

The configuration file should have a INI-style format and the [IniConfig](#) class will thus be used to parse the file. The above mentioned attributes should be placed in the common section. Another section is also valid in the configuration file, which is the alias section. Here it is possible to define aliases representing one or multiple services. These aliases can be used in the [AddServices\(const std::list<std::string>&, ServiceType\)](#) and [AddServices\(const std::list<std::string>&, const std::list<std::string>&, ServiceType\)](#) methods.

The [UserConfig](#) class also provides a method [InitializeCredentials\(\)](#) for locating user credentials by searching in different standard locations. The [CredentialsFound\(\)](#) method can be used to test if locating the credentials succeeded.

5.321.2 Constructor & Destructor Documentation

5.321.2.1 Arc::UserConfig::UserConfig (*initializeCredentialsType initializeCredentials = initializeCredentialsType ()*)

Create a [UserConfig](#) object. The [UserConfig](#) object created by this constructor initializes only default values, and if specified by the *initializeCredentials* boolean credentials will be tried initialized using the [InitializeCredentials\(\)](#) method. The object is only non-valid if initialization of credentials fails which can be checked with the [operator bool\(\)](#) method.

Parameters:

initializeCredentials is a optional boolean indicating if the [InitializeCredentials\(\)](#) method should be invoked, the default is `true`.

See also:

[InitializeCredentials\(\)](#)
[operator bool\(\)](#)

5.321.2.2 Arc::UserConfig::UserConfig (const std::string & *conffile*, initializeCredentialsType *initializeCredentials* = initializeCredentialsType (), bool *loadSysConfig* = true)

Create a [UserConfig](#) object. The [UserConfig](#) object created by this constructor will, if specified by the *loadSysConfig* boolean, first try to load the system configuration file by invoking the [LoadConfigurationFile\(\)](#) method, and if this fails a WARNING is reported. Then the configuration file passed will be tried loaded using the before mentioned method, and if this fails an ERROR is reported, and the created object will be non-valid. Note that if the passed file path is empty the example configuration will be tried copied to the default configuration file path specified by DEFAULTCONFIG. If the example file cannot be copied one or more WARNING messages will be reported and no configuration will be loaded. If loading the configurations file succeeded and if *initializeCredentials* is true then credentials will be initialized using the [InitializeCredentials\(\)](#) method, and if no valid credentials are found the created object will be non-valid.

Parameters:

conffile is the path to a INI-configuration file.

initializeCredentials is a boolean indicating if credentials should be initialized, the default is true.

loadSysConfig is a boolean indicating if the system configuration file should be loaded aswell, the default is true.

See also:

[LoadConfigurationFile\(const std::string&, bool\)](#)

[InitializeCredentials\(\)](#)

[operator bool\(\)](#)

[SYSCONFIG](#)

[EXAMPLECONFIG](#)

5.321.2.3 Arc::UserConfig::UserConfig (const std::string & *conffile*, const std::string & *jfile*, initializeCredentialsType *initializeCredentials* = initializeCredentialsType (), bool *loadSysConfig* = true)

Create a [UserConfig](#) object. The [UserConfig](#) object created by this constructor does only differ from the [UserConfig\(const std::string&, bool, bool\)](#) constructor in that it is possible to pass the path of the job list file directly to this constructor. If the job list file *joblistfile* is empty, the behaviour of this constructor is exactly the same as the before mentioned, otherwise the job list file will be initialized by invoking the setter method [JobListFile\(const std::string&\)](#). If it fails the created object will be non-valid, otherwise the specified configuration file *conffile* will be loaded with the *ignoreJobListFile* argument set to true.

Parameters:

conffile is the path to a INI-configuration file

jfile is the path to a (non-)existing job list file.

initializeCredentials is a boolean indicating if credentials should be initialized, the default is true.

loadSysConfig is a boolean indicating if the system configuration file should be loaded aswell, the default is true.

See also:

[JobListFile\(const std::string&\)](#)

[LoadConfigurationFile\(const std::string&, bool\)](#)

[InitializeCredentials\(\)](#)

[operator bool\(\)](#)

5.321.2.4 Arc::UserConfig::UserConfig (const long int & *ptraddr*)

Language binding constructor. The passed long int should be a pointer address to a [UserConfig](#) object, and this address is then casted into this [UserConfig](#) object.

Parameters:

ptraddr is an memory address to a [UserConfig](#) object.

5.321.3 Member Function Documentation

5.321.3.1 void Arc::UserConfig::AddBartender (const URL & *url*) [inline]

Set bartenders, used to contact Chelonia. Takes as input a Bartender [URL](#) and adds this to the list of bartenders.

Parameters:

url is a [URL](#) to be added to the list of bartenders.

See also:

[Bartender\(const std::list<URL>&\)](#)
[Bartender\(\) const](#)

5.321.3.2 void Arc::UserConfig::ApplyToConfig (BaseConfig & *ccfg*) const

Apply credentials to [BaseConfig](#). This methods sets the [BaseConfig](#) credentials to the credentials contained in this object. It also passes user defined configuration overlay if any.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\)](#)
[BaseConfig](#)

Parameters:

ccfg a [BaseConfig](#) object which will configured with the credentials of this object.

5.321.3.3 const std::vector<URL>& Arc::UserConfig::Bartender () const [inline]

Get bartenders. Returns a list of Bartender URLs

Returns:

The list of bartender [URL](#) objects is returned.

See also:

[Bartender\(const std::list<URL>&\)](#)
[AddBartender\(const URL&\)](#)

5.321.3.4 bool Arc::UserConfig::Bartender (const std::vector< URL > & urls) [inline]

Set bartenders, used to contact Chelonia. Takes as input a vector of Bartender URLs.

The attribute associated with this setter method is 'bartender'.

Parameters:

urls is a list of [URL](#) object to be set as bartenders.

Returns:

This method always returns `true`.

See also:

[AddBartender\(const URL&\)](#)
[Bartender\(\) const](#)

5.321.3.5 const std::pair<std::string, std::string>& Arc::UserConfig::Broker () const [inline]

Get the broker and corresponding arguments. The returned pair contains the broker name as the first component and the argument as the second.

See also:

[Broker\(const std::string&\)](#)
[Broker\(const std::string&, const std::string&\)](#)
[DEFAULT_BROKER](#)

5.321.3.6 bool Arc::UserConfig::Broker (const std::string & name, const std::string & argument) [inline]

Set broker to use in target matching. As opposed to the [Broker\(const std::string&\)](#) method this method sets broker name and arguments directly from the passed two arguments.

Two attributes are associated with this setter method 'brokername' and 'brokerarguments'.

Parameters:

name is the name of the broker.
argument is the arguments of the broker.

Returns:

This method always returns `true`.

See also:

[Broker](#)
[Broker\(const std::string&\)](#)
[Broker\(\) const](#)
[DEFAULT_BROKER](#)

5.321.3.7 bool Arc::UserConfig::Broker (const std::string & *name*)

Set broker to use in target matching. The string passed to this method should be in the format:

<name> [:<*argument*>]

where the *<name>* is the name of the broker and cannot contain any ':', and the optional *<argument>* should contain arguments which should be passed to the broker.

Two attributes are associated with this setter method 'brokername' and 'brokerarguments'.

Parameters:

name the broker name and argument specified in the format given above.

Returns:

This method always returns `true`.

See also:

[Broker](#)

[Broker\(const std::string&, const std::string&\)](#)

[Broker\(\) const](#)

[DEFAULT_BROKER](#)

5.321.3.8 const std::string& Arc::UserConfig::CACertificatePath () const [inline]

Get path to CA-certificate. Retrieve the path to the file containing CA-certificate. This configuration parameter is deprecated.

Returns:

The path to the CA-certificate is returned.

See also:

[CACertificatePath\(const std::string&\)](#)

5.321.3.9 bool Arc::UserConfig::CACertificatePath (const std::string & *newCACertificatePath*) [inline]

Set CA-certificate path. The path to the file containing CA-certificate will be set when calling this method. This configuration parameter is deprecated - use CACertificatesDirectory instead. Only arcscls uses it.

The attribute associated with this setter method is 'cacertificatepath'.

Parameters:

newCACertificatePath is the path to the CA-certificate.

Returns:

This method always returns `true`.

See also:

[CACertificatePath\(\) const](#)

5.321.3.10 const std::string& Arc::UserConfig::CACertificatesDirectory () const [inline]

Get path to CA-certificate directory. Retrieve the path to the CA-certificate directory.

Returns:

The path to the CA-certificate directory is returned.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\) const](#)
[CACertificatesDirectory\(const std::string&\)](#)

5.321.3.11 bool Arc::UserConfig::CACertificatesDirectory (const std::string & newCACertificatesDirectory) [inline]

Set path to CA-certificate directory. The path to the directory containing CA-certificates will be set when calling this method. Note that the [InitializeCredentials\(\)](#) method will also try to set this path, by searching in different locations.

The attribute associated with this setter method is 'cacertificatesdirectory'.

Parameters:

newCACertificatesDirectory is the path to the CA-certificate directory.

Returns:

This method always returns `true`.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\) const](#)
[CACertificatesDirectory\(\) const](#)

5.321.3.12 const Period& Arc::UserConfig::CertificateLifeTime () const [inline]

Get certificate life time. Gets lifetime of user certificate which will be obtained from Short Lived Credentials [Service](#).

Returns:

The certificate life time is returned as a [Period](#) object.

See also:

[CertificateLifeTime\(const Period&\)](#)

5.321.3.13 bool Arc::UserConfig::CertificateLifeTime (const Period & *newCertificateLifeTime*) [inline]

Set certificate life time. Sets lifetime of user certificate which will be obtained from Short Lived Credentials Service.

The attribute associated with this setter method is 'certificatelifetime'.

Parameters:

newCertificateLifeTime is the life time of a certificate, as a [Period](#) object.

Returns:

This method always returns `true`.

See also:

[CertificateLifeTime\(\) const](#)

5.321.3.14 const std::string& Arc::UserConfig::CertificatePath () const [inline]

Get path to certificate. The path to the cerficate is returned when invoking this method.

Returns:

The certificate path is returned.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\) const](#)
[CertificatePath\(const std::string&\)](#)
[KeyPath\(\) const](#)

5.321.3.15 bool Arc::UserConfig::CertificatePath (const std::string & *newCertificatePath*) [inline]

Set path to certificate. The path to user certificate will be set by this method. The path to the correecsponding key can be set with the [KeyPath\(const std::string&\)](#) method. Note that the [InitializeCredentials\(\)](#) method will also try to set this path, by searching in different locations.

The attribute associated with this setter method is 'certificatepath'.

Parameters:

newCertificatePath is the path to the new certificate.

Returns:

This method always returns `true`.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\) const](#)
[CertificatePath\(\) const](#)
[KeyPath\(const std::string&\)](#)

5.321.3.16 bool Arc::UserConfig::CredentialsFound () const [inline]

Validate credential location. Valid credentials consists of a combination of a path to existing CA-certificate directory and either a path to existing proxy or a path to existing user key/certificate pair. If valid credentials are found this method returns `true`, otherwise `false` is returned.

Returns:

`true` if valid credentials are found, otherwise `false`.

See also:

[InitializeCredentials\(\)](#)

5.321.3.17 const User& Arc::UserConfig:: GetUser () const [inline]

Get [User](#) for filesystem access.

Returns:

The user identity to use for file system access

See also:

[SetUser\(const User&\)](#)

5.321.3.18 const std::string& Arc::UserConfig::IdPName () const [inline]

Get IdP name. Gets Identity Provider name (Shibboleth) to which user belongs.

Returns:

The IdP name

See also:

[IdPName\(const std::string&\)](#)

5.321.3.19 bool Arc::UserConfig::IdPName (const std::string & *name*) [inline]

Set IdP name. Sets Identity Provider name (Shibboleth) to which user belongs. It is used for contacting Short Lived Certificate [Service](#).

The attribute associated with this setter method is 'idpname'.

Parameters:

name is the new IdP name.

Returns:

This method always returns `true`.

See also:

5.321.3.20 bool Arc::UserConfig::InitializeCredentials (*initializeCredentialsType initializeCredentials*)

Initialize user credentials. The location of the user credentials will be tried located when calling this method and stored internally when found. The method searches in different locations. Depending on value of *initializeCredentials* this method behaves differently. Following is an explanation for *RequireCredentials*. For less strict values see information below. First the user proxy or the user key/certificate pair is tried located in the following order:

- Proxy path specified by the environment variable X509_USER_PROXY. If value is set and corresponding file does not exist it considered to be an error and no other locations are tried. If found no more proxy paths are tried.
- Current proxy path as passed to the constructor, explicitly set using the setter method [ProxyPath\(const std::string&\)](#) or read from configuration by constructor or [LoadConfiguartionFile\(\)](#) method. If value is set and corresponding file does not exist it considered to be an error and no other locations are tried. If found no more proxy paths are tried.
- Proxy path made of x509up_u token concatenated with the user numerical ID located in the OS temporary directory. It is NOT an error if corresponding file does not exist and processing continues.
- Key/certificate paths specified by the environment variables X509_USER_KEY and X509_USER_CERT. If values are set and corresponding files do not exist it considered to be an error and no other locations are tried. Error message is suppressed if proxy was previously found.
- Current key/certificate paths passed to the constructor or explicitly set using the setter methods [KeyPath\(const std::string&\)](#) and [CertificatePath\(const std::string&\)](#) or read from configuration by constructor or [LoadConfiguartionFile\(\)](#) method. If values are set and corresponding files do not exist it is an error and no other locations are tried. Error message is suppressed if proxy was previously found.
- Key/certificate paths `~/.arc/usercert.pem` and `~/.arc/userkey.pem` respectively are tried. It is not an error if not found.
- Key/certificate paths `~/.globus/usercert.pem` and `~/.globus/userkey.pem` respectively are tried. It is not an error if not found.
- Key/certificate paths created by concatenation of ARC installation location and `/etc/arc/usercert.pem` and `/etc/arc/userkey.pem` respectively are tried. It is not an error if not found.
- Key/certificate located in current working directory are tried.
- If neither proxy nor key/certificate files are found this is considered to be an error.

Along with the proxy and key/certificate pair, the path of the directory containing CA certificates is also located. The presence of directory will be checked in the following order and first found is accepted:

- Path specified by the X509_CERT_DIR environment variable. It is an error if value is set and directory does not exist.
- Current path explicitly specified by using the setter method [CACertificatesDirectory\(\)](#) or read from configuration by constructor or [LoadConfiguartionFile\(\)](#) method. It is an error if value is set and directory does not exist.
- Path `~/.globus/certificates`. It is not an error if it does not exist.
- Path created by concatenating the ARC installation location and `/etc/certificates`. It is not an error if it does not exist.

- Path created by concatenating the ARC installation location and /share/certificates. It is not an error if it does not exist.
- Path /etc/grid-security/certificates.

It is an error if none of the directories above exist.

In case of initializeCredentials == TryCredentials method behaves same way like in case RequireCredentials except it does not report errors through its [Logger](#) object and does not return false.

If NotTryCredentials is used method does not check for presence of credentials. It behaves like if corresponding files are always present.

And in case of SkipCredentials method does nothing.

All options with SkipCA* prefix behaves similar to those without prefix except the path of the directory containing CA certificates is completely ignored.

See also:

[CredentialsFound\(\)](#)

[KeyPath\(const std::string&\)](#)
[CertificatePath\(const std::string&\)](#)
[CACertificatesDirectory\(const std::string&\)](#)

5.321.3.21 const std::string& Arc::UserConfig::JobDownloadDirectory () const [inline]

Get download directory. returns directory which will be used to download the job directory using arcget command.

The attribute associated with the method is 'jobdownloaddirectory'.

Returns:

This method returns the job download directory.

See also:

5.321.3.22 bool Arc::UserConfig::JobDownloadDirectory (const std::string & newDownloadDirectory) [inline]

Set download directory. Sets directory which will be used to download the job directory using arcget command.

The attribute associated with this setter method is 'jobdownloaddirectory'.

Parameters:

newDownloadDirectory is the path to the download directory.

Returns:

This method always returns `true`.

See also:

5.321.3.23 const std::string& Arc::UserConfig::JobListFile () const [inline]

Get a reference to the path of the job list file. The job list file is used to store and fetch information about submitted computing jobs to computing services. This method will return the path to the specified job list file.

Returns:

The path to the job list file is returned.

See also:

[JobListFile\(const std::string&\)](#)

5.321.3.24 bool Arc::UserConfig::JobListFile (const std::string &path)

Set path to job list file. The method takes a path to a file which will be used as the job list file for storing and reading job information. If the specified path *path* does not exist a empty job list file will be tried created. If creating the job list file in any way fails *false* will be returned and a ERROR message will be reported. Otherwise *true* is returned. If the directory containing the file does not exist, it will be tried created. The method will also return *false* if the file is not a regular file.

The attribute associated with this setter method is 'joblist'.

Parameters:

path the path to the job list file.

Returns:

If the job list file is a regular file or if it can be created *true* is returned, otherwise *false* is returned.

See also:

[JobListFile\(\) const](#)

5.321.3.25 const std::string& Arc::UserConfig::KeyPassword () const [inline]

Get password for generated key. Get password to be used to encode private key of credentials obtained from Short Lived Credentials Service.

Returns:

The key password is returned.

See also:

[KeyPassword\(const std::string&\)](#)

[KeyPath\(\) const](#)

[KeySize\(\) const](#)

5.321.3.26 bool Arc::UserConfig::KeyPassword (const std::string & *newKeyPassword*) [inline]

Set password for generated key. Set password to be used to encode private key of credentials obtained from Short Lived Credentials Service.

The attribute associated with this setter method is 'keypassword'.

Parameters:

newKeyPassword is the new password to the key.

Returns:

This method always returns true.

See also:

[KeyPassword\(\)](#) const
[KeyPath\(const std::string&\)](#)
[KeySize\(int\)](#)

5.321.3.27 const std::string& Arc::UserConfig::KeyPath () const [inline]

Get path to key. The path to the key is returned when invoking this method.

Returns:

The path to the user key is returned.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\)](#) const
[KeyPath\(const std::string&\)](#)
[CertificatePath\(\)](#) const
[KeyPassword\(\)](#) const
[KeySize\(\)](#) const

5.321.3.28 bool Arc::UserConfig::KeyPath (const std::string & *newKeyPath*) [inline]

Set path to key. The path to user key will be set by this method. The path to the corresponding certificate can be set with the [CertificatePath\(const std::string&\)](#) method. Note that the [InitializeCredentials\(\)](#) method will also try to set this path, by searching in different locations.

The attribute associated with this setter method is 'keypath'.

Parameters:

newKeyPath is the path to the new key.

Returns:

This method always returns true.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\) const](#)
[KeyPath\(\) const](#)
[CertificatePath\(const std::string&\)](#)
[KeyPassword\(const std::string&\)](#)
[KeySize\(int\)](#)

5.321.3.29 int Arc::UserConfig::KeySize () const [inline]

Get key size. Get size/strengt of private key of credentials obtained from Short Lived Credentials [Service](#).

Returns:

The key size, as an integer, is returned.

See also:

[KeySize\(int\)](#)
[KeyPath\(\) const](#)
[KeyPassword\(\) const](#)

5.321.3.30 bool Arc::UserConfig::KeySize (int *newKeySize*) [inline]

Set key size. Set size/strengt of private key of credentials obtained from Short Lived Credentials [Service](#).

The attribute associated with this setter method is 'keysize'.

Parameters:

newKeySize is the size, an an integer, of the key.

Returns:

This method always returns `true`.

See also:

[KeySize\(\) const](#)
[KeyPath\(const std::string&\)](#)
[KeyPassword\(const std::string&\)](#)

5.321.3.31 bool Arc::UserConfig::LoadConfigurationFile (const std::string & *confFile*, bool *ignoreJobListFile = true*)

Load specified configuration file. The configuration file passed is parsed by this method by using the [IniConfig](#) class. If the parsing is unsuccessful a WARNING is reported.

The format of the configuration file should follow that of INI, and every attribute present in the file is only allowed once, if otherwise a WARNING will be reported. The file can contain at most two sections, one named common and the other name alias. If other sections exist a WARNING will be reported. Only the following attributes is allowed in the common section of the configuration file:

- certificatepath ([CertificatePath\(const std::string&\)](#))
- keypath ([KeyPath\(const std::string&\)](#))
- proxypath ([ProxyPath\(const std::string&\)](#))
- cacertificatesdirectory ([CACertificatesDirectory\(const std::string&\)](#))
- cacertificatepath ([CACertificatePath\(const std::string&\)](#))
- timeout ([Timeout\(int\)](#))
- joblist ([JobListFile\(const std::string&\)](#))
- verbosity ([Verbosity\(const std::string&\)](#))
- brokername ([Broker\(const std::string&\)](#) or [Broker\(const std::string&, const std::string&\)](#))
- brokerarguments ([Broker\(const std::string&\)](#) or [Broker\(const std::string&, const std::string&\)](#))
- bartender ([Bartender\(const std::list<URL>&\)](#))
- vomsserverpath ([VOMSESPPath\(const std::string&\)](#))
- username ([UserName\(const std::string&\)](#))
- password ([Password\(const std::string&\)](#))
- keypassword ([KeyPassword\(const std::string&\)](#))
- keysize ([KeySize\(int\)](#))
- certificatelifetime ([CertificateLifeTime\(const Period&\)](#))
- slcs ([SLCS\(const URL&\)](#))
- storedirectory ([StoreDirectory\(const std::string&\)](#))
- jobdownloaddirectory ([JobDownloadDirectory\(const std::string&\)](#))
- idpname ([IdPName\(const std::string&\)](#))

where the method in parentheses is the associated setter method. If other attributes exist in the common section a WARNING will be reported for each of these attributes. In the alias section aliases can be defined, and should represent a selection of services. The alias can then referred to by input to the AddServices(const std::list<std::string>&, ServiceType) and AddServices(const std::list<std::string>&, const std::list<std::string>&, ServiceType) methods. An alias can not contain any of the characters '.', ':' , ' ' or '\t' and should be defined as follows:

```
<alias_name>=<service_type>:<flavour>:<service_url> | <alias_ref> [...]
```

where <alias_name> is the name of the defined alias, <service_type> is the service type in lower case, <flavour> is the type of middleware plugin to use, <service_url> is the [URL](#) which should be used to contact the service and <alias_ref> is another defined alias. The parsed aliases will be stored internally and resolved when needed. If a alias already exist, and another alias with the same name is parsed then this other alias will overwrite the existing alias.

Parameters:

confiile is the path to the configuration file.

ignoreJobListFile is a optional boolean which indicates whether the joblistfile attribute in the configuration file should be ignored. Default is to ignore it (`true`).

Returns:

If loading the configuration file succeeds `true` is returned, otherwise `false` is returned.

See also:

[SaveToFile\(\)](#)

5.321.3.32 Arc::UserConfig::operator bool (void) const [inline]

Check for validity. The validity of an object created from this class can be checked using this casting operator. An object is valid if the constructor did not encounter any errors.

See also:

[operator!\(\)](#)

5.321.3.33 bool Arc::UserConfig::operator! (void) const [inline]

Check for non-validity. See [operator bool\(\)](#) for a description.

See also:

[operator bool\(\)](#)

5.321.3.34 const std::string& Arc::UserConfig::OverlayFile () const [inline]

Get path to configuration overlay file.

Returns:

The overlay file path

See also:

[OverlayFile\(const std::string&\)](#)

5.321.3.35 bool Arc::UserConfig::OverlayFile (const std::string &path) [inline]

Set path to configuration overlay file. Content of specified file is a backdoor to configuration XML generated from information stored in this class. The content of file is passed to [BaseConfig](#) class in [ApplyToConfig\(BaseConfig&\)](#) then merged with internal configuration XML representation. This feature is meant for quick prototyping/testing/tuning of functionality without rewriting code. It is meant for developers and most users won't need it.

The attribute associated with this setter method is 'overlayfile'.

Parameters:

path is the new overlay file path.

Returns:

This method always returns true.

See also:**5.321.3.36 const std::string& Arc::UserConfig::Password () const [inline]**

Get password. Get password which is used for requesting credentials from Short Lived Credentials [Service](#).

Returns:

The password is returned.

See also:

[Password\(const std::string&\)](#)

5.321.3.37 bool Arc::UserConfig::Password (const std::string & newPassword) [inline]

Set password. Set password which is used for requesting credentials from Short Lived Credentials [Service](#).

The attribute associated with this setter method is 'password'.

Parameters:

newPassword is the new password to set.

Returns:

This method always returns true.

See also:

[Password\(\) const](#)

5.321.3.38 const std::string& Arc::UserConfig::ProxyPath () const [inline]

Get path to user proxy. Retrieve path to user proxy.

Returns:

Returns the path to the user proxy.

See also:

[ProxyPath\(const std::string&\)](#)

5.321.3.39 bool Arc::UserConfig::ProxyPath (const std::string & *newProxyPath*) [inline]

Set path to user proxy. This method will set the path of the user proxy. Note that the [InitializeCredentials\(\)](#) method will also try to set this path, by searching in different locations.

The attribute associated with this setter method is 'proxypath'

Parameters:

newProxyPath is the path to a user proxy.

Returns:

This method always returns `true`.

See also:

[InitializeCredentials\(\)](#)
[CredentialsFound\(\)](#)
[ProxyPath\(\) const](#)

5.321.3.40 bool Arc::UserConfig::SaveToFile (const std::string & *filename*) const

Save to INI file. This method will save the object data as a INI file. The saved file can be loaded with the [LoadConfigurationFile](#) method.

Parameters:

filename the name of the file which the data will be saved to.

Returns:

`false` if unable to get handle on file, otherwise `true` is returned.

See also:

[LoadConfigurationFile\(\)](#)

5.321.3.41 void Arc::UserConfig::SetUser (const User & *u*) [inline]

Set [User](#) for filesystem access. Sometimes it is desirable to use the identity of another user when accessing the filesystem. This user can be specified through this method. By default this user is the same as the user running the process.

Parameters:

u [User](#) identity to use

5.321.3.42 const URL& Arc::UserConfig::SLCS () const [inline]

Get the [URL](#) to the Short Lived Certificate [Service](#) (SLCS).

Returns:

The SLCS is returned.

See also:

[SLCS\(const URL&\)](#)

5.321.3.43 bool Arc::UserConfig::SLCS (const URL & *newSLCS*) [inline]

Set the [URL](#) to the Short Lived Certificate [Service](#) (SLCS). The attribute associated with this setter method is 'slcs'.

Parameters:

newSLCS is the [URL](#) to the SLCS

Returns:

This method always returns `true`.

See also:

[SLCS\(\) const](#)

5.321.3.44 const std::string& Arc::UserConfig::StoreDirectory () const [inline]

Get store directory. Sets directory which is used to store credentials obtained from Short Lived [Credential](#) Servide.

Returns:

The path to the store directory is returned.

See also:

[StoreDirectory\(const std::string&\)](#)

5.321.3.45 bool Arc::UserConfig::StoreDirectory (const std::string & *newStoreDirectory*) [inline]

Set store directory. Sets directory which will be used to store credentials obtained from Short Lived [Credential](#) Servide.

The attribute associated with this setter method is 'storedirectory'.

Parameters:

newStoreDirectory is the path to the store directory.

Returns:

This method always returns `true`.

See also:

5.321.3.46 int Arc::UserConfig::Timeout () const [inline]

Get timeout. Returns the timeout in seconds.

Returns:

timeout in seconds.

See also:

[Timeout\(int\)](#)
[DEFAULT_TIMEOUT](#)

5.321.3.47 bool Arc::UserConfig::Timeout (int *newTimeout*)

Set timeout. When communicating with a service the timeout specifies how long, in seconds, the communicating instance should wait for a response. If the response have not been received before this period in time, the connection is typically dropped, and an error will be reported.

This method will set the timeout to the specified integer. If the passed integer is less than or equal to 0 then `false` is returned and the timeout will not be set, otherwise `true` is returned and the timeout will be set to the new value.

The attribute associated with this setter method is 'timeout'.

Parameters:

newTimeout the new timeout value in seconds.

Returns:

`false` in case *newTimeout* <= 0, otherwise `true`.

See also:

[Timeout\(\) const](#)
[DEFAULT_TIMEOUT](#)

5.321.3.48 const std::string& Arc::UserConfig::UserName () const [inline]

Get user-name. Get username which is used for requesting credentials from Short Lived Credentials [Service](#).

Returns:

The username is returned.

See also:

[UserName\(const std::string&\)](#)

5.321.3.49 bool Arc::UserConfig::UserName (const std::string & *name*) [inline]

Set user-name for SLCS. Set username which is used for requesting credentials from Short Lived Credentials Service.

The attribute associated with this setter method is 'username'.

Parameters:

name is the name of the user.

Returns:

This method always return true.

See also:

[UserName\(\) const](#)

5.321.3.50 const std::string& Arc::UserConfig::UtilsDirPath () const [inline]

Get path to directory storing utility files for DataPoints.

Returns:

The utils dir path

See also:

[UtilsDirPath\(const std::string&\)](#)

5.321.3.51 bool Arc::UserConfig::UtilsDirPath (const std::string & *dir*)

Set path to directory storing utility files for DataPoints. Some DataPoints can store information on remote services in local files. This method sets the path to the directory containing these files. For example arc* tools set it to ARCUSERDIRECTORY and A-REX sets it to the control directory. The directory is created if it does not exist.

Parameters:

path is the new utils dir path.

Returns:

This method always returns true.

5.321.3.52 const std::string& Arc::UserConfig::Verbosity () const [inline]

Get the user selected level of verbosity. The string representation of the verbosity level specified by the user is returned when calling this method. If the user have not specified the verbosity level the empty string will be referenced.

Returns:

the verbosity level, or empty if it has not been set.

See also:

[Verbosity\(const std::string&\)](#)

5.321.3.53 bool Arc::UserConfig::Verbosity (const std::string & *newVerbosity*)

Set verbosity. The verbosity will be set when invoking this method. If the string passed cannot be parsed into a corresponding LogLevel, using the function a WARNING is reported and `false` is returned, otherwise `true` is returned.

The attribute associated with this setter method is 'verbosity'.

Returns:

`true` in case the verbosity could be set to a allowed LogLevel, otherwise `false`.

See also:

[Verbosity\(\) const](#)

5.321.3.54 const std::string& Arc::UserConfig::VOMSESPath ()

Get path to file containing VOMS configuration. Get path to file which contains list of VOMS services and associated configuration parameters.

Returns:

The path to VOMS configuration file is returned.

See also:

[VOMSESPath\(const std::string&\)](#)

5.321.3.55 bool Arc::UserConfig::VOMSESPath (const std::string & *path*) [inline]

Set path to file containing VOMS configuration. Set path to file which contains list of VOMS services and associated configuration parameters needed to contact those services. It is used by arcproxy.

The attribute associated with this setter method is 'vomsserverpath'.

Parameters:

path the path to VOMS configuration file

Returns:

This method always return true.

See also:

[VOMSESPath\(\) const](#)

5.321.4 Field Documentation

5.321.4.1 const std::string Arc::UserConfig::ARCUSERDIRECTORY [static]

Path to ARC user home directory. The *ARCUSERDIRECTORY* variable is the path to the ARC home directory of the current user. This path is created using the User::Home() method.

See also:

User::Home()

5.321.4.2 const std::string Arc::UserConfig::DEFAULT_BROKER [static]

Default broker. The *DEFAULT_BROKER* specifies the name of the broker which should be used in case no broker is explicitly chosen.

See also:

[Broker](#)
[Broker\(const std::string&\)](#)
[Broker\(const std::string&, const std::string&\)](#)
[Broker\(\) const](#)

5.321.4.3 const int Arc::UserConfig::DEFAULT_TIMEOUT = 20 [static]

Default timeout in seconds. The *DEFAULT_TIMEOUT* specifies interval which will be used in case no timeout interval have been explicitly specified. For a description about timeout see [Timeout\(int\)](#).

See also:

[Timeout\(int\)](#)
[Timeout\(\) const](#)

5.321.4.4 const std::string Arc::UserConfig::DEFAULTCONFIG [static]

Path to default configuration file. The *DEFAULTCONFIG* variable is the path to the default configuration file used in case no configuration file have been specified. The path is created from the ARCUSERDIRECTORY object.

5.321.4.5 const std::string Arc::UserConfig::EXAMPLECONFIG [static]

Path to example configuration. The *EXAMPLECONFIG* variable is the path to the example configuration file.

5.321.4.6 const std::string Arc::UserConfig::SYSCONFIG [static]

Path to system configuration. The *SYSCONFIG* variable is the path to the system configuration file. This variable is only equal to SYSCONFIGARCLOC if ARC is installed in the root (highly unlikely).

5.321.4.7 const std::string Arc::UserConfig::SYSCONFIGARCLOC [static]

Path to system configuration at ARC location. The *SYSCONFIGARCLOC* variable is the path to the system configuration file which reside at the ARC installation location.

The documentation for this class was generated from the following file:

- UserConfig.h

5.322 Arc::UsernameToken Class Reference

Interface for manipulation of WS-Security according to Username Token [Profile](#).

```
#include <UsernameToken.h>
```

Public Types

- enum [PasswordType](#)

Public Member Functions

- [UsernameToken](#) (SOAPEnvelope &soap)

- [operator bool](#) (void)
- std::string [Username](#) (void)
- bool [Authenticate](#) (const std::string &password, std::string &derived_key)
- bool [Authenticate](#) (std::istream &password, std::string &derived_key)

5.322.1 Detailed Description

Interface for manipulation of WS-Security according to Username Token [Profile](#).

5.322.2 Member Enumeration Documentation

5.322.2.1 enum Arc::UsernameToken::PasswordType

SOAP header element

5.322.3 Constructor & Destructor Documentation

5.322.3.1 Arc::UsernameToken::UsernameToken (SOAPEnvelope & soap)

Link to existing SOAP header and parse Username Token information. Username Token related information is extracted from SOAP header and stored in class variables.

5.322.3.2 Arc::UsernameToken::UsernameToken (SOAPEnvelope & soap, const std::string & username, const std::string & password, const std::string & uid, [PasswordType](#) pwdtype)

Add Username Token information into the SOAP header. Generated token contains elements Username and Password and is meant to be used for authentication.

Parameters:

soap the SOAP message

username <wsse:Username>...</wsse:Username> - if empty it is entered interactively from stdin
password <wsse:Password Type="...">...</wsse:Password> - if empty it is entered interactively from stdin
uid <wsse:UsernameToken wsu:ID="...">
pwdtype <wsse:Password Type="...">...</wsse:Password>

5.322.3.3 Arc::UsernameToken::UsernameToken (SOAPEnvelope & *soap*, const std::string & *username*, const std::string & *id*, bool *mac*, int *iteration*)

Add Username Token information into the SOAP header. Generated token contains elements Username and Salt and is meant to be used for deriving Key Derivation.

Parameters:

soap the SOAP message
username <wsse:Username>...</wsse:Username>
mac if derived key is meant to be used for [Message](#) Authentication Code
iteration <wsse11:Iteration>...</wsse11:Iteration>

5.322.4 Member Function Documentation

5.322.4.1 bool Arc::UsernameToken::Authenticate (std::istream & *password*, std::string & *derived_key*)

Checks parsed token against password stored in specified stream. If token is meant to be used for deriving a key then key is returned in *derived_key*

5.322.4.2 bool Arc::UsernameToken::Authenticate (const std::string & *password*, std::string & *derived_key*)

Checks parsed/generated token against specified password. If token is meant to be used for deriving a key then key is returned in *derived_key*. In that case authentication is performed outside of [UsernameToken](#) class using obtained *derived_key*.

5.322.4.3 Arc::UsernameToken::operator bool (void)

Returns true if constructor succeeded

5.322.4.4 std::string Arc::UsernameToken::Username (void)

Returns username associated with this instance

The documentation for this class was generated from the following file:

- UsernameToken.h

5.323 Arc::UserSwitch Class Reference

```
#include <User.h>
```

5.323.1 Detailed Description

If this class is created user identity is switched to provided uid and gid. Due to internal lock there will be only one valid instance of this class. Any attempt to create another instance will block till first one is destroyed. If uid and gid are set to 0 then user identity is not switched. But lock is applied anyway. The lock has dual purpose. First and most important is to protect communication with underlying operating system which may depend on user identity. For that it is advisable for code which talks to operating system to acquire valid instance of this class. Care must be taken for not to hold that instance too long cause that may block other code in multithreaded environment. Other purpose of this lock is to provide workaround for glibc bug in __nptl_setuid. That bug causes lockup of seteuid() function if racing with fork. To avoid this problem the lock mentioned above is used by [Run](#) class while spawning new process.

The documentation for this class was generated from the following file:

- User.h

5.324 Arc::VOMSACInfo Class Reference

The documentation for this class was generated from the following file:

- VOMSUtil.h

5.325 Arc::VOMSTrustList Class Reference

```

- VOMSTrustChain & [AddChain](#) (void)
- [RegularExpression](#) & [AddRegex](#) (const VOMSTrustRegex ®)

5.325.1 Detailed Description

Stores definitions for making decision if VOMS server is trusted

5.325.2 Constructor & Destructor Documentation

5.325.2.1 Arc::VOMSTrustList::VOMSTrustList (const std::vector< std::string > & encoded_list)

Creates chain lists and regexps from plain list. List is made of chunks delimited by elements containing pattern "NEXT CHAIN". Each chunk with more than one element is converted into one instance of VOMSTrustChain. Chunks with single element are converted to VOMSTrustChain if element does not have special symbols. Otherwise it is treated as regular expression. Those symbols are '^','\$', and '*'. Trusted chains can be configured in two ways: one way is: <tls:VOMSCertTrustDNChain><tls:VOMSCertTrustDN>/O=Grid/O=NorduGrid/CN=host/arthur.hep.lu.se</tls:VOMSCertTrustDN><tls:VOMSCertTrustDN>/O=Grid/O=NorduGrid/CN=NorduGrid Certification Authority</tls:VOMSCertTrustDN> <tls:VOMSCertTrustDN>----NEXT CHAIN---</tls:VOMSCertTrustDN> <tls:VOMSCertTrustDN>/DC=ch/DC=cern/OU=computers/CN=voms.cern.ch</tls:VOMSCertTrustDN><tls:VOMSCertTrustDN>/DC=ch/DC=cern/CN=CERN Trusted Certification Authority</tls:VOMSCertTrustDN> </tls:VOMSCertTrustDNChain> the other way is: <tls:VOMSCertTrustDNChain> <tls:VOMSCertTrustDN>/O=Grid/O=NorduGrid/CN=host/arthur.hep.lu.se</tls:VOMSCertTrustDN><tls:VOMSCertTrustDN>/O=Grid/O=NorduGrid/CN=NorduGrid Certification Authority</tls:VOMSCertTrustDN> </tls:VOMSCertTrustDNChain> <tls:VOMSCertTrustDN><tls:VOMSCertTrustDN>/DC=ch/DC=cern/OU=computers/CN=voms.cern.ch</tls:VOMSCertTrustDN><tls:VOMSCertTrustDN>/DC=ch/DC=cern/CN=CERN Trusted Certification Authority</tls:VOMSCertTrustDN> </tls:VOMSCertTrustDNChain> each chunk is supposed to contain a suit of DN of trusted certificate chain, in which the first DN is the DN of the certificate (cert0) which is used to sign the Attribute Certificate (AC), the second DN is the DN of the issuer certificate(cert1) which is used to sign cert0. So if there are one or more intermediate issuers, then there should be 3 or more than 3 DNs in this chunk (considering cert0 and the root certificate, plus the intermediate certificate).

5.325.2.2 Arc::VOMSTrustList::VOMSTrustList (const std::vector< VOMSTrustChain > & chains, const std::vector< VOMSTrustRegex > & regexs)

Creates chain lists and regexps from those specified in arguments. See [AddChain\(\)](#) and [AddRegex\(\)](#) for more information.

5.325.3 Member Function Documentation

5.325.3.1 VOMSTrustChain& Arc::VOMSTrustList::AddChain (void)

Adds empty chain of trusted DNs to list.

5.325.3.2 VOMSTrustChain& Arc::VOMSTrustList::AddChain (const VOMSTrustChain & *chain*)

Adds chain of trusted DNs to list. During verification each signature of AC is checked against all stored chains. DNs of chain of certificate used for signing AC are compared against DNs stored in these chains one by one. If needed DN of issuer of last certificate is checked too. Comparison succeeds if DNs in at least one stored chain are same as those in certificate chain. Comparison stops when all DNs in stored chain are compared. If there are more DNs in stored chain than in certificate chain then comparison fails. Empty stored list matches any certificate chain. Taking into account that certificate chains are verified down to trusted CA anyway, having more than one DN in stored chain seems to be useless. But such feature may be found useful by some very strict sysadmins. ??? IMO, DN list here is not only for authentication, it is also kind of ACL, which means the AC consumer only trusts those DNs which issues AC.

5.325.3.3 RegularExpression& Arc::VOMSTrustList::AddRegex (const VOMSTrustRegex & *reg*)

Adds regular expression to list. During verification each signature of AC is checked against all stored regular expressions. DN of signing certificate must match at least one of stored regular expressions.

The documentation for this class was generated from the following file:

- VOMSUtil.h

5.326 Arc::WSAEndpointReference Class Reference

Interface for manipulation of WS-Addressing [Endpoint](#) Reference.

```
#include <WSA.h>
```

Public Member Functions

- [WSAEndpointReference \(XMLNode epr\)](#)
- [WSAEndpointReference \(const WSAEndpointReference &wsa\)](#)
- [WSAEndpointReference \(const std::string &address\)](#)
- [WSAEndpointReference \(void\)](#)
- [~WSAEndpointReference \(void\)](#)
- [std::string Address \(void\) const](#)
- [bool hasAddress \(void\) const](#)
- [void Address \(const std::string &uri\)](#)
- [WSAEndpointReference & operator= \(const std::string &address\)](#)
- [XMLNode ReferenceParameters \(void\)](#)
- [XMLNode MetaData \(void\)](#)
- [operator XMLNode \(void\)](#)

5.326.1 Detailed Description

Interface for manipulation of WS-Addressing [Endpoint](#) Reference. It works on [Endpoint](#) Reference stored in XML tree. No information is stored in this object except reference to corresponding XML subtree.

5.326.2 Constructor & Destructor Documentation

5.326.2.1 Arc::WSAEndpointReference::WSAEndpointReference (XMLNode *epr*)

Link to top level EPR XML node Linking to existing EPR in XML tree

5.326.2.2 Arc::WSAEndpointReference::WSAEndpointReference (const WSAEndpointReference & *wsa*)

Copy constructor

5.326.2.3 Arc::WSAEndpointReference::WSAEndpointReference (const std::string & *address*)

Creating independent EPR - not implemented

5.326.2.4 Arc::WSAEndpointReference::WSAEndpointReference (void)

Dummy constructor - creates invalid instance

5.326.2.5 Arc::WSAEndpointReference::~WSAEndpointReference (void)

Destructor. All empty elements of EPR XML are destroyed here too

5.326.3 Member Function Documentation

5.326.3.1 void Arc::WSAEndpointReference::Address (const std::string & *uri*)

Assigns new Address value. If EPR had no Address element it is created.

5.326.3.2 std::string Arc::WSAEndpointReference::Address (void) const

Returns Address ([URL](#)) encoded in EPR

5.326.3.3 bool Arc::WSAEndpointReference::hasAddress (void) const

Returns true if Address is defined

5.326.3.4 XMLNode Arc::WSAEndpointReference::MetaData (void)

Access to MetaData element of EPR. Obtained XML element should be manipulated directly in application-dependent way. If EPR had no MetaData element it is created.

5.326.3.5 Arc::WSAEndpointReference::operator XMLNode (void)

Returns reference to EPR top XML node

5.326.3.6 WSAEndpointReference& Arc::WSAEndpointReference::operator= (const std::string & *address*)

Same as Address(*uri*)

5.326.3.7 XMLNode Arc::WSAEndpointReference::ReferenceParameters (void)

Access to ReferenceParameters element of EPR. Obtained XML element should be manipulated directly in application-dependent way. If EPR had no ReferenceParameters element it is created.

The documentation for this class was generated from the following file:

- WSA.h

5.327 Arc::WSAHeader Class Reference

Interface for manipulation WS-Addressing information in SOAP header.

```

Protected Attributes

- [bool header_allocated_](#)

5.327.1 Detailed Description

Interface for manipulation WS-Addressing information in SOAP header. It works on [Endpoint](#) Reference stored in XML tree. No information is stored in this object except reference to corresponding XML subtree.

5.327.2 Constructor & Destructor Documentation

5.327.2.1 Arc::WSAHeader::WSAHeader (SOAPEnvelope & *soap*)

Linking to a header of existing SOAP message

5.327.2.2 Arc::WSAHeader::WSAHeader (const std::string & *action*)

Creating independent SOAP header - not implemented

5.327.3 Member Function Documentation

5.327.3.1 void Arc::WSAHeader::Action (const std::string & *uri*)

Set content of Action element of SOAP Header. If such element does not exist it's created.

5.327.3.2 std::string Arc::WSAHeader::Action (void) const

Returns content of Action element of SOAP Header.

5.327.3.3 static bool Arc::WSAHeader::Check (SOAPEnvelope & *soap*) [static]

Tells if specified SOAP message has WSA header

5.327.3.4 WSAEndpointReference Arc::WSAHeader::FaultTo (void)

Returns FaultTo element of SOAP Header. If such element does not exist it's created. Obtained element may be manipulated.

5.327.3.5 WSAEndpointReference Arc::WSAHeader::From (void)

Returns From element of SOAP Header. If such element does not exist it's created. Obtained element may be manipulated.

5.327.3.6 bool Arc::WSAHeader::hasAction (void) const

Returns true if Action element is defined.

5.327.3.7 bool Arc::WSAHeader::hasMessageID (void) const

Returns true if MessageID element is defined.

5.327.3.8 bool Arc::WSAHeader::hasRelatesTo (void) const

Returns true if RelatesTo element is defined.

5.327.3.9 bool Arc::WSAHeader::hasRelationshipType (void) const

Returns true if RelationshipType element is defined.

5.327.3.10 bool Arc::WSAHeader::hasTo (void) const

Returns true if To element is defined.

5.327.3.11 void Arc::WSAHeader::MessageID (const std::string & *uri*)

Set content of MessageID element of SOAP Header. If such element does not exist it's created.

5.327.3.12 std::string Arc::WSAHeader::MessageID (void) const

Returns content of MessageID element of SOAP Header.

5.327.3.13 XMLNode Arc::WSAHeader::NewReferenceParameter (const std::string & *name*)

Creates new ReferenceParameter element with specified name. Returns reference to created element.

5.327.3.14 Arc::WSAHeader::operator XMLNode (void)

Returns reference to SOAP Header - not implemented

5.327.3.15 XMLNode Arc::WSAHeader::ReferenceParameter (const std::string & *name*)

Returns first ReferenceParameter element with specified name

5.327.3.16 XMLNode Arc::WSAHeader::ReferenceParameter (int *n*)

Return n-th ReferenceParameter element

5.327.3.17 void Arc::WSAHeader::RelatesTo (const std::string & *uri*)

Set content of RelatesTo element of SOAP Header. If such element does not exist it's created.

5.327.3.18 std::string Arc::WSAHeader::RelatesTo (void) const

Returns content of RelatesTo element of SOAP Header.

5.327.3.19 void Arc::WSAHeader::RelationshipType (const std::string & *uri*)

Set content of RelationshipType element of SOAP Header. If such element does not exist it's created.

5.327.3.20 std::string Arc::WSAHeader::RelationshipType (void) const

Returns content of RelationshipType element of SOAP Header.

5.327.3.21 WSAEndpointReference Arc::WSAHeader::ReplyTo (void)

Returns ReplyTo element of SOAP Header. If such element does not exist it's created. Obtained element may be manipulated.

5.327.3.22 void Arc::WSAHeader::To (const std::string & *uri*)

Set content of To element of SOAP Header. If such element does not exist it's created.

5.327.3.23 std::string Arc::WSAHeader::To (void) const

Returns content of To element of SOAP Header.

5.327.4 Field Documentation

5.327.4.1 bool Arc::WSAHeader::header_allocated_ [protected]

SOAP header element

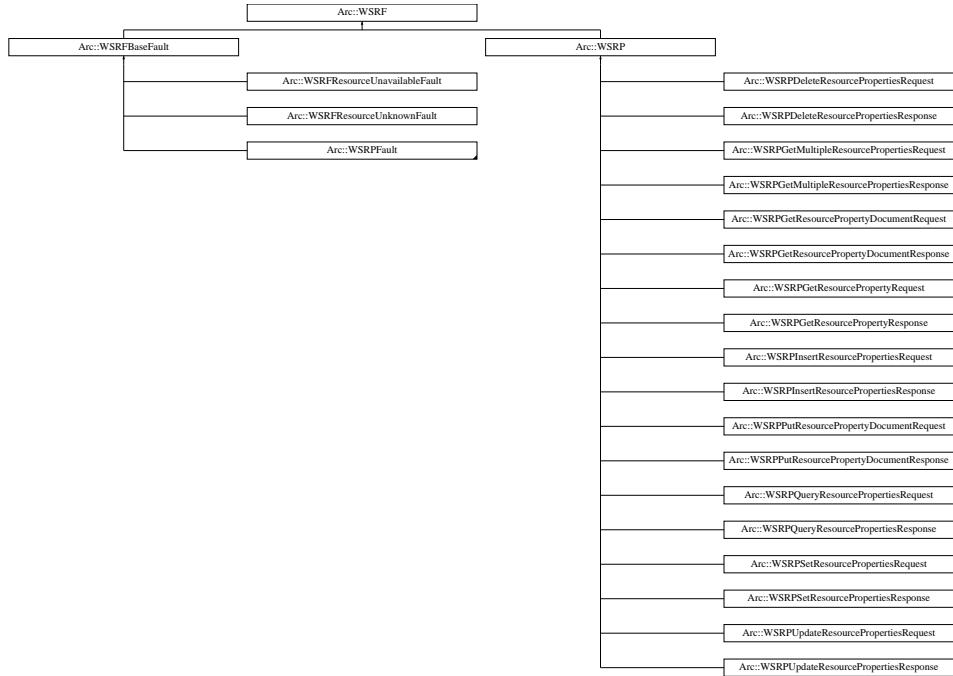

The documentation for this class was generated from the following file:

- WSA.h

5.328 Arc::WSRF Class Reference

Base class for every [WSRF](#) message.

#include <WSRF.h> Inheritance diagram for Arc::WSRF::

Public Member Functions

- [WSRF](#) (SOAPEnvelope &soap, const std::string &action="")
- [WSRF](#) (bool fault=false, const std::string &action="")
- virtual SOAPEnvelope & [SOAP](#) (void)
- virtual [operator bool](#) (void)

Protected Member Functions

- void [set_namespaces](#) (void)

Protected Attributes

- bool [allocated_](#)
- bool [valid_](#)

5.328.1 Detailed Description

Base class for every [WSRF](#) message. This class is not intended to be used directly. Use it like reference while passing through unknown [WSRF](#) message or use classes derived from it.

5.328.2 Constructor & Destructor Documentation

5.328.2.1 Arc::WSRF::WSRF (SOAPEnvelope & soap, const std::string & action = "")

Constructor - creates object out of supplied SOAP tree.

5.328.2.2 Arc::WSRF::WSRF (bool fault = false, const std::string & action = "")

Constructor - creates new [WSRF](#) object

5.328.3 Member Function Documentation

5.328.3.1 virtual Arc::WSRF::operator bool (void) [inline, virtual]

Returns true if instance is valid

References valid_.

5.328.3.2 void Arc::WSRF::set_namespaces (void) [protected]

true if object represents valid [WSRF](#) message set WS Resource namespaces and default prefixes in SOAP message

Reimplemented in [Arc::WSRP](#), and [Arc::WSRFBaseFault](#).

5.328.3.3 virtual SOAPEnvelope& Arc::WSRF::SOAP (void) [inline, virtual]

Direct access to underlying SOAP element

5.328.4 Field Documentation

5.328.4.1 bool Arc::WSRF::allocated_ [protected]

Associated SOAP message - it's SOAP message after all

5.328.4.2 bool Arc::WSRF::valid_ [protected]

true if soap_ needs to be deleted in destructor

Referenced by operator bool().

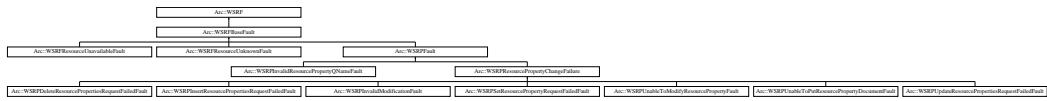

The documentation for this class was generated from the following file:

- WSRF.h

5.329 Arc::WSRFBaseFault Class Reference

Base class for [WSRF](#) fault messages.

```
#include <WSRFBaseFault.h>
```

Public Member Functions

- [WSRFBaseFault](#) (SOAPEnvelope &soap)
- [WSRFBaseFault](#) (const std::string &type)

Protected Member Functions

- void [set_namespaces](#) (void)

5.329.1 Detailed Description

Base class for [WSRF](#) fault messages. Use classes inherited from it for specific faults.

5.329.2 Constructor & Destructor Documentation

5.329.2.1 Arc::WSRFBaseFault::WSRFBaseFault (SOAPEnvelope & soap)

Constructor - creates object out of supplied SOAP tree.

5.329.2.2 Arc::WSRFBaseFault::WSRFBaseFault (const std::string & type)

Constructor - creates new [WSRF](#) fault

5.329.3 Member Function Documentation

5.329.3.1 void Arc::WSRFBaseFault::set_namespaces (void) [protected]

set WS-ResourceProperties namespaces and default prefixes in SOAP message

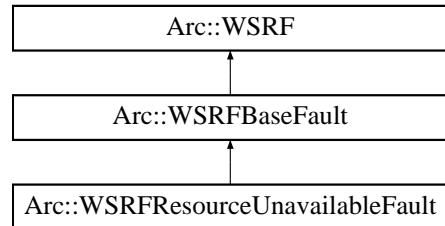

Reimplemented from [Arc::WSRF](#).

The documentation for this class was generated from the following file:

- WSRFBaseFault.h

5.330 Arc::WSRFResourceUnavailableFault Class Reference

Inheritance diagram for Arc::WSRFResourceUnavailableFault::

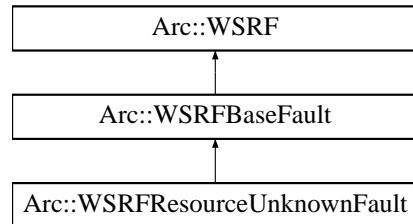

The documentation for this class was generated from the following file:

- WSRFBaseFault.h

Inheritance diagram for Arc::WSRFResourceUnknownFault::

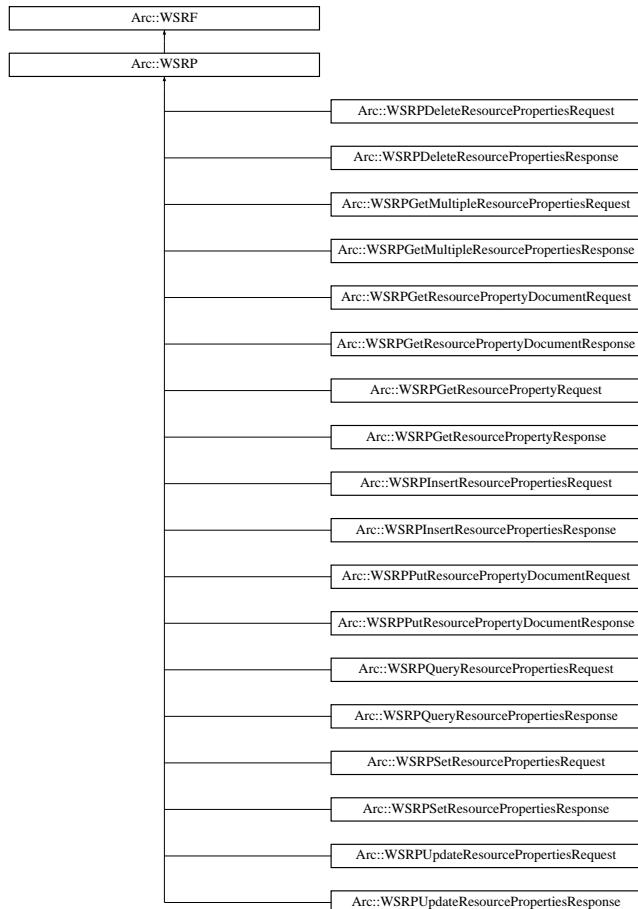

The documentation for this class was generated from the following file:

- WSRFBaseFault.h

5.332 Arc::WSRP Class Reference

Base class for WS-ResourceProperties structures.

```
#include <WSResourceProperties.h>
```

Public Member Functions

- [WSRP](#) (bool fault=false, const std::string &action="")
- [WSRP](#) (SOAPEnvelope &soap, const std::string &action="")

Protected Member Functions

- void [set_namespaces](#) (void)

5.332.1 Detailed Description

Base class for WS-ResourceProperties structures. Inheriting classes implement specific WS-ResourceProperties messages and their properties/elements. Refer to WS-ResourceProperties specifications for things specific to every message.

5.332.2 Constructor & Destructor Documentation

5.332.2.1 Arc::WSRP::WSRP (bool *fault* = **false**, const std::string & *action* = "")

Constructor - prepares object for creation of new [WSRP](#) request/response/fault

5.332.2.2 Arc::WSRP::WSRP (SOAPEnvelope & *soap*, const std::string & *action* = "")

Constructor - creates object out of supplied SOAP tree. It does not check if 'soap' represents valid WS-ResourceProperties structure. Actual check for validity of structure has to be done by derived class.

5.332.3 Member Function Documentation

5.332.3.1 void Arc::WSRP::set_namespaces (void) [protected]

set WS-ResourceProperties namespaces and default prefixes in SOAP message

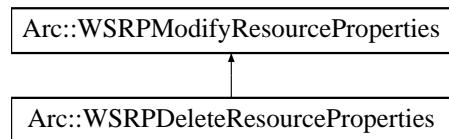

Reimplemented from [Arc::WSRF](#).

5.366 Arc::X509Token Class Reference

Class for manipulating X.509 Token [Profile](#).

```
#include <X509Token.h>
```

Public Types

- enum [X509TokenType](#)

Public Member Functions

- [X509Token](#) (SOAPEnvelope &soap, const std::string &keyfile="")
- [X509Token](#) (SOAPEnvelope &soap, const std::string &certfile, const std::string &keyfile, [X509TokenType](#) token_type=Signature)
- [~X509Token](#) (void)
- [operator bool](#) (void)
- bool [Authenticate](#) (const std::string &cafile, const std::string &capath)
- bool [Authenticate](#) (void)

5.366.1 Detailed Description

Class for manipulating X.509 Token [Profile](#). This class is for generating/consuming X.509 Token profile. Currently it is used by x509token handler (src/hed/pdc/x509tokensh/) It is not necessary to directly called this class. If we need to use X.509 Token functionality, we only need to configure the x509token handler into service and client.

5.366.2 Member Enumeration Documentation

5.366.2.1 enum Arc::X509Token::X509TokenType

X509TokenType is for distinguishing two types of operation. It is used as the parameter of constructor.

5.366.3 Constructor & Destructor Documentation

5.366.3.1 Arc::X509Token::X509Token (SOAPEnvelope & soap, const std::string & keyfile = "")

Constructor.Parse X509 Token information from SOAP header. X509 Token related information is extracted from SOAP header and stored in class variables. And then if the [X509Token](#) object will be used for authentication if the tokentype is Signature; otherwise if the tokentype is Encryption, the encrypted soap body will be decrypted and replaced by decrypted message. keyfile is only needed when the [X509Token](#) is encryption token

5.366.3.2 Arc::X509Token::X509Token (SOAPEnvelope & soap, const std::string & certfile, const std::string & keyfile, [X509TokenType](#) token_type = Signature)

Constructor. Add X509 Token information into the SOAP header. Generated token contains elements X509 token and signature, and is meant to be used for authentication on the consuming side.

Parameters:

soap The SOAP message to which the X509 Token will be inserted
certfile The certificate file which will be used to encrypt the SOAP body (if parameter tokentype is Encryption), or be used as <wsse:BinarySecurityToken/> (if parameter tokentype is Signature).
keyfile The key file which will be used to create signature. Not needed when create encryption.
tokentype Token type: Signature or Encryption.

5.366.3.3 Arc::X509Token::~X509Token (void)

Deconstructor. Nothing to be done except finalizing the xmlsec library.

5.366.4 Member Function Documentation**5.366.4.1 bool Arc::X509Token::Authenticate (void)**

Check signature by using the cert information in soap message. Only the signature itself is checked, and it is not guaranteed that the certificate which is supposed to check the signature is trusted.

5.366.4.2 bool Arc::X509Token::Authenticate (const std::string & *cafle*, const std::string & *capath*)

Check signature by using the certicate information in [X509Token](#) which is parsed by the constructor, and the trusted certificates specified as one of the two parameters. Not only the signature (in the [X509Token](#)) itself is checked, but also the certificate which is supposed to check the signature needs to be trused (which means the certificate is issued by the ca certificate from CA file or CA directory). At least one the the two parameters should be set.

Parameters:

cafle The CA file
capath The CA directory

Returns:

true if authentication passes; otherwise false

5.366.4.3 Arc::X509Token::operator bool (void)

Returns true of constructor succeeded

5.369.1 Detailed Description

Wrapper for LibXML library Tree interface. This class wraps XML Node, Document and Property/Attribute structures. Each instance serves as pointer to actual LibXML element and provides convenient (for chosen purpose) methods for manipulating it. This class has no special ties to LibXML library and may be easily rewritten for any XML parser which provides interface similar to LibXML Tree. It implements only small subset of XML capabilities, which is probably enough for performing most of useful actions. This class also filters out (usually) useless textual nodes which are often used to make XML documents human-readable.

5.369.2 Constructor & Destructor Documentation

5.369.2.1 Arc::XMLNode::XMLNode (xmlNodePtr *node*) [inline, protected]

Private constructor for inherited classes Creates instance and links to existing LibXML structure. Acquired structure is not owned by class instance. If there is need to completely pass control of LibXML document to then instance's *is_owner_* variable has to be set to true.

5.369.2.2 Arc::XMLNode::XMLNode (void) [inline]

Constructor of invalid node Created instance does not point to XML element. All methods are still allowed for such instance but produce no results.

5.369.2.3 Arc::XMLNode::XMLNode (const XMLNode & *node*) [inline]

Copies existing instance. Underlying XML element is NOT copied. Ownership is NOT inherited. Strictly speaking it shuld be no const here - but that conflicts with C++.

5.369.2.4 Arc::XMLNode::XMLNode (const std::string & *xml*)

Creates XML document structure from textual representation of XML document. Created structure is pointed and owned by constructed instance

5.369.2.5 Arc::XMLNode::XMLNode (const char * *xml*, int *len* = -1)

Same as previous

5.369.2.6 Arc::XMLNode::XMLNode (long *ptr_addr*)

Copy constructor. Used by language bindigs

5.369.2.7 Arc::XMLNode::XMLNode (const NS & *ns*, const char * *name*)

Creates empty XML document structure with specified namespaces. Created XML contains only root element named '*name*'. Created structure is pointed and owned by constructed instance

5.369.2.8 Arc::XMLNode::~XMLNode (void)

Destructor Also destroys underlying XML document if owned by this instance

5.369.3 Member Function Documentation**5.369.3.1 XMLNode Arc::XMLNode::Attribute (const std::string & name) [inline]**

Returns [XMLNode](#) instance representing first attribute of node with specified by name

References Attribute().

5.369.3.2 XMLNode Arc::XMLNode::Attribute (const char * name)

Returns [XMLNode](#) instance representing first attribute of node with specified by name

5.369.3.3 XMLNode Arc::XMLNode::Attribute (int n = 0)

Returns list of all attributes of node. Returns [XMLNode](#) instance reresenting n-th attribute of node.

Referenced by Attribute().

5.369.3.4 int Arc::XMLNode::AttributesSize (void) const

Returns number of attributes of node

5.369.3.5 XMLNode Arc::XMLNode::Child (int n = 0)

Returns [XMLNode](#) instance representing n-th child of XML element. If such does not exist invalid [XMLNode](#) instance is returned

5.369.3.6 void Arc::XMLNode::Destroy (void)

Destroys underlying XML element. XML element is unlinked from XML tree and destroyed. After this operation [XMLNode](#) instance becomes invalid

5.369.3.7 void Arc::XMLNode::Exchange (XMLNode & node)

Exchanges XML (sub)trees. Following combinations are possible If either this or node are refering owned XML tree (top level node) then references are simply exchanged. This operation is fast. If both this and node are refering to XML (sub)tree of different documents then (sub)trees are exchanged between documents. If both this and node are refering to XML (sub)tree of same document then (sub)trees are moved inside document. The main reason for this method is to provide effective way to insert one XML document inside another. One should take into account that if any of exchanged nodes is top level it must be also owner of document. Otherwise method will fail. If both nodes are top level owners and/or invalid nodes then this method is identical to [Swap\(\)](#).

5.369.3.8 std::string Arc::XMLNode::FullName (void) const [inline]

Returns prefix:name of XML node

References Name(), and Prefix().

5.369.3.9 XMLNode Arc::XMLNode::Get (const std::string & name) const [inline]

Same as operator[]

References operator[]().

5.369.3.10 void Arc::XMLNode::GetDoc (std::string & out_xml_str, bool user_friendly = false) const

Fills argument with whole XML document textual representation

5.369.3.11 XMLNode Arc::XMLNode::GetRoot (void)

Get the root node from any child node of the tree

5.369.3.12 void Arc::XMLNode::GetXML (std::string & out_xml_str, const std::string & encoding, bool user_friendly = false) const

Fills argument with this instance XML subtree textual representation if the XML subtree is corresponding to the encoding format specified in the argument, e.g. utf-8

5.369.3.13 void Arc::XMLNode::GetXML (std::string & out_xml_str, bool user_friendly = false) const

Fills argument with this instance XML subtree textual representation

5.369.3.14 void Arc::XMLNode::Move (XMLNode & node)

Moves content of this XML (sub)tree to node This opeartion is similar to New except that XML (sub)tree to refered by this is destroyed. This method is more effective than combination of [New\(\)](#) and [Destroy\(\)](#) because internally it is optimized not to copy data if not needed. The main purpose of this is to effectively extract part of XML document.

5.369.3.15 void Arc::XMLNode::Name (const std::string & name) [inline]

Assigns new name to XML node

References Name().

5.369.3.16 void Arc::XMLNode::Name (const char * name)

Assigns new name to XML node

5.369.3.17 std::string Arc::XMLNode::Name (void) const

Returns name of XML node

Referenced by FullName(), and Name().

5.369.3.18 std::string Arc::XMLNode::Namespace (void) const

Returns namespace URI of XML node

5.369.3.19 std::string Arc::XMLNode::NamespacePrefix (const char * *urn*)

Returns prefix of specified namespace. Empty string if no such namespace.

5.369.3.20 NS Arc::XMLNode::Namespaces (void)

Returns namespaces known at this node

5.369.3.21 void Arc::XMLNode::Namespaces (const NS & *namespaces*, bool *keep* = **false, int *recursion* = -1)**

Assigns namespaces of XML document at point specified by this instance. If namespace already exists it gets new prefix. New namespaces are added. It is useful to apply this method to XML being processed in order to refer to its elements by known prefix. If keep is set to false existing namespace definition residing at this instance and below are removed (default behavior). If recursion is set to positive number then depth of prefix replacement is limited by this number (0 limits it to this node only). For unlimited recursion use -1. If recursion is limited then value of keep is ignored and existing namespaces are always kept.

5.369.3.22 void Arc::XMLNode::New (XMLNode & *node*) const

Creates a copy of XML (sub)tree. If object does not represent whole document - top level document is created. 'node' becomes a pointer owning new XML document.

5.369.3.23 XMLNode Arc::XMLNode::NewAttribute (const std::string & *name*) [inline]

Creates new attribute with specified name.

References NewAttribute().

5.369.3.24 XMLNode Arc::XMLNode::NewAttribute (const char * *name*)

Creates new attribute with specified name.

Referenced by NewAttribute().

5.369.3.25 XMLNode Arc::XMLNode::NewChild (const XMLNode & *node*, int *n* = -1, bool *global_order* = **false)**

Link a copy of supplied XML node as child. Returns instance referring to new child. XML element is a copy of supplied one but not owned by returned instance

5.369.3.26 XMLNode Arc::XMLNode::NewChild (const std::string & name, const NS & namespaces, int n = -1, bool global_order = false) [inline]

Same as [NewChild\(const char*,const NS&,int,bool\)](#)

References [NewChild\(\)](#).

5.369.3.27 XMLNode Arc::XMLNode::NewChild (const char * name, const NS & namespaces, int n = -1, bool global_order = false)

Creates new child XML element at specified position with specified name and namespaces. For more information look at [NewChild\(const char*,int,bool\)](#)

5.369.3.28 XMLNode Arc::XMLNode::NewChild (const std::string & name, int n = -1, bool global_order = false) [inline]

Same as [NewChild\(const char*,int,bool\)](#)

References [NewChild\(\)](#).

5.369.3.29 XMLNode Arc::XMLNode::NewChild (const char * name, int n = -1, bool global_order = false)

Creates new child XML element at specified position with specified name. Default is to put it at end of list. If global order is true position applies to whole set of children, otherwise only to children of same name. Returns created node.

Referenced by [NewChild\(\)](#).

5.369.3.30 Arc::XMLNode::operator bool (void) const [inline]

Returns true if instance points to XML element - valid instance

References [is_temporary_](#).

5.369.3.31 Arc::XMLNode::operator std::string (void) const

Returns textual content of node excluding content of children nodes

5.369.3.32 bool Arc::XMLNode::operator! (void) const [inline]

Returns true if instance does not point to XML element - invalid instance

References [is_temporary_](#).

5.369.3.33 bool Arc::XMLNode::operator!= (const char * str) [inline]

This operator is needed to avoid ambiguity

5.369.3.34 bool Arc::XMLNode::operator!= (const std::string & str) [inline]

This operator is needed to avoid ambiguity

5.369.3.35 bool Arc::XMLNode::operator!= (bool val) [inline]

This operator is needed to avoid ambiguity

5.369.3.36 bool Arc::XMLNode::operator!= (const XMLNode & node) [inline]

Returns false if 'node' represents same XML element

5.369.3.37 void Arc::XMLNode::operator++ (void)

Convenience operator to switch to next element of same name. If there is no such node this object becomes invalid.

5.369.3.38 void Arc::XMLNode::operator-- (void)

Convenience operator to switch to previous element of same name. If there is no such node this object becomes invalid.

5.369.3.39 XMLNode& Arc::XMLNode::operator= (const XMLNode & node)

Make instance refer to another XML node. Ownership is not inherited. Due to nature of [XMLNode](#) there should be no const here, but that does not fit into C++.

5.369.3.40 XMLNode& Arc::XMLNode::operator= (const std::string & content) [inline]

Sets textual content of node. All existing children nodes are discarded.

References operator=().

5.369.3.41 XMLNode& Arc::XMLNode::operator= (const char * content)

Sets textual content of node. All existing children nodes are discarded.

Referenced by operator=(), and Set().

5.369.3.42 bool Arc::XMLNode::operator== (const char * str) [inline]

This operator is needed to avoid ambiguity

5.369.3.43 bool Arc::XMLNode::operator== (const std::string & str) [inline]

This operator is needed to avoid ambiguity

5.369.3.44 bool Arc::XMLNode::operator== (bool *val*) [inline]

This operator is needed to avoid ambiguity

5.369.3.45 bool Arc::XMLNode::operator== (const XMLNode & *node*) [inline]

Returns true if 'node' represents same XML element

Referenced by Same().

5.369.3.46 XMLNode Arc::XMLNode::operator[] (int *n*) const

Returns [XMLNode](#) instance representing n-th node in sequence of siblings of same name. It's main purpose is to be used to retrieve element in array of children of same name like *node*[*"name"*][5]. This method should not be marked const because obtaining unrestricted [XMLNode](#) of child element allows modification of underlying XML tree. But in order to keep const in other places non-const-handling is passed to programmer. Otherwise C++ compiler goes nuts.

5.369.3.47 XMLNode Arc::XMLNode::operator[] (const std::string & *name*) const [inline]

Similar to previous method

References operator[]().

5.369.3.48 XMLNode Arc::XMLNode::operator[] (const char * *name*) const

Returns [XMLNode](#) instance representing first child element with specified name. Name may be "namespace_prefix:name", "namespace_uri:name" or simply "name". In last case namespace is ignored. If such node does not exist invalid [XMLNode](#) instance is returned. This method should not be marked const because obtaining unrestricted [XMLNode](#) of child element allows modification of underlying XML tree. But in order to keep const in other places non-const-handling is passed to programmer. Otherwise C++ compiler goes nuts.

Referenced by Get(), and operator[]().

5.369.3.49 XMLNode Arc::XMLNode::Parent (void)

Get the parent node from any child node of the tree

5.369.3.50 XMLNodeList Arc::XMLNode::Path (const std::string & *path*)

Collects nodes corresponding to specified path. This is a convenience function to cover common use of XPath but without performance hit. Path is made of *node_name[/node_name[...]]* and is relative to current node. *node_names* are treated in same way as in operator[]. Returns all nodes which are represented by path.

5.369.3.51 std::string Arc::XMLNode::Prefix (void) const

Returns namespace prefix of XML node

Referenced by FullName().

5.369.3.52 bool Arc::XMLNode::ReadFromFile (const std::string & *file_name*)

Read XML document from file and associate it with this node

5.369.3.53 bool Arc::XMLNode::ReadFromStream (std::istream & *in*)

Read XML document from stream and associate it with this node

5.369.3.54 void Arc::XMLNode::Replace (const XMLNode & *node*)

Makes a copy of supplied XML node and makes this instance refere to it

5.369.3.55 bool Arc::XMLNode::Same (const XMLNode & *node*) [inline]

Returns true if 'node' represents same XML element - for bindings

References operator==().

5.369.3.56 bool Arc::XMLNode::SaveToFile (const std::string & *file_name*) const

Save string representation of node to file

5.369.3.57 bool Arc::XMLNode::SaveToStream (std::ostream & *out*) const

Save string representation of node to stream

5.369.3.58 void Arc::XMLNode::Set (const std::string & *content*) [inline]

Same as operator=. Used for bindings.

References operator=().

5.369.3.59 int Arc::XMLNode::Size (void) const

Returns number of children nodes

5.369.3.60 void Arc::XMLNode::Swap (XMLNode & *node*)

Swaps XML (sub)trees to this this and node refer. For XML subtrees this method is not anyhow different then using combinaion `XMLNode tmp=*this; *this=node; node=tmp;` But in case of either this or node owning XML document ownership is swapped too. And this is a main purpose of `Swap()` method.

5.369.3.61 bool Arc::XMLNode::Validate (const std::string & *schema_file*, std::string & *err_msg*)

Remove all eye-candy information leaving only informational parts * void Purify(void); XML schema validation against the schema file defined as argument

5.369.3.62 XMLNodeList Arc::XMLNode::XPathLookup (const std::string & *xpathExpr*, const NS & *nsList*)

Uses xPath to look up the whole xml structure, Returns a list of [XMLNode](#) points. The xpathExpr should be like "//xx:child1/" which indicates the namespace and node that you would like to find; The nsList is the namespace the result should belong to (e.g. xx="uri:test"). [Query](#) is run on whole XML document but only the elements belonging to this XML subtree are returned.

5.369.4 Field Documentation

5.369.4.1 bool Arc::XMLNode::is_owner_ [protected]

If true node is owned by this instance - hence released in destructor. Normally that may be true only for top level node of XML document.

5.369.4.2 bool Arc::XMLNode::is_temporary_ [protected]

This variable is for future

Referenced by operator bool(), and operator!().

The documentation for this class was generated from the following file:

5.370.1 Detailed Description

Container for multiple `XMLNode` elements

5.370.2 Constructor & Destructor Documentation

5.370.2.1 Arc::XMLNodeContainer::XMLNodeContainer (void)

Default constructor

5.370.2.2 Arc::XMLNodeContainer::XMLNodeContainer (const XMLNodeContainer &)

Copy constructor. Add nodes from argument. Nodes owning XML document are copied using `AddNew()`. Not owning nodes are linked using `Add()` method.

5.370.3 Member Function Documentation

5.370.3.1 void Arc::XMLNodeContainer::Add (const std::list< XMLNode > &)

Link multiple XML subtrees to container.

5.370.3.2 void Arc::XMLNodeContainer::Add (const XMLNode &)

Link XML subtree refered by node to container. XML tree must be available as long as this object is used.

5.370.3.3 void Arc::XMLNodeContainer::AddNew (const std::list< XMLNode > &)

Copy multiple XML subtrees to container.

5.370.3.4 void Arc::XMLNodeContainer::AddNew (const XMLNode &)

Copy XML subtree referenced by node to container. After this operation container refers to independent XML document. This document is deleted when container is destroyed.

5.370.3.5 std::list<XMLNode> Arc::XMLNodeContainer::Nodes (void)

Returns all stored nodes.

5.370.3.6 XMLNodeContainer& Arc::XMLNodeContainer::operator= (const XMLNodeContainer &)

Same as copy constructor with current nodes being deleted first.

5.370.3.7 XMLNode Arc::XMLNodeContainer::operator[] (int)

Returns n-th node in a store.

5.370.3.8 int Arc::XMLNodeContainer::Size (void) const

Return number of referred/stored nodes.

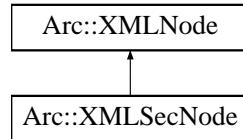

The documentation for this class was generated from the following file:

- XMLNode.h

5.371 Arc::XMLSecNode Class Reference

Extends [XMLNode](#) class to support XML security operation.

```
#include <XMLSecNode.h>
```

Public Member Functions

- [XMLSecNode \(XMLNode &node\)](#)
- void [AddSignatureTemplate \(const std::string &id_name, const SignatureMethod sign_method, const std::string &incl_namespaces=""\)](#)
- bool [SignNode \(const std::string &privkey_file, const std::string &cert_file\)](#)
- bool [VerifyNode \(const std::string &id_name, const std::string &ca_file, const std::string &ca_path, bool verify_trusted=true\)](#)
- bool [EncryptNode \(const std::string &cert_file, const SymEncryptionType encrypt_type\)](#)
- bool [DecryptNode \(const std::string &privkey_file, XMLNode &decrypted_node\)](#)

5.371.1 Detailed Description

Extends [XMLNode](#) class to support XML security operation. All [XMLNode](#) methods are exposed by inheriting from [XMLNode](#). [XMLSecNode](#) itself does not own node, instead it uses the node from the base class [XMLNode](#).

5.371.2 Constructor & Destructor Documentation

5.371.2.1 Arc::XMLSecNode::XMLSecNode (XMLNode & *node*)

Create a object based on an [XMLNode](#) instance.

5.371.3 Member Function Documentation

5.371.3.1 void Arc::XMLSecNode::AddSignatureTemplate (const std::string & *id_name*, const SignatureMethod *sign_method*, const std::string & *incl_namespaces* = "")

Add the signature template for later signing.

Parameters:

id_name The identifier name under this node which will be used for the <Signature> to refer to.

sign_method The sign method for signing. Two options now, RSA_SHA1, DSA_SHA1

5.371.3.2 bool Arc::XMLSecNode::DecryptNode (const std::string & *privkey_file*, XMLNode & *decrypted_node*)

Decrypt the <xenc:EncryptedData/> under this node, the decrypted node will be output in the second argument of DecryptNode method. And the <xenc:EncryptedData/> under this node will be removed after decryption.

Parameters:

- privkey_file* The private key file, which is used for decrypting
- decrypted_node* Output the decrypted node

5.371.3.3 bool Arc::XMLSecNode::EncryptNode (const std::string & *cert_file*, const SymEncryptionType *encript_type*)

Encrypt this node, after encryption, this node will be replaced by the encrypted node

Parameters:

- cert_file* The certificate file, the public key parsed from this certificate is used to encrypted the symmetric key, and then the symmetric key is used to encrypted the node
- encript_type* The encryption type when encrypting the node, four option in SymEncryptionType
- verify_trusted* Verify trusted certificates or not. If set to false, then only the signature will be checked (by using the public key from KeyInfo).

5.371.3.4 bool Arc::XMLSecNode::SignNode (const std::string & *privkey_file*, const std::string & *cert_file*)

Sign this node (identified by id_name).

Parameters:

- privkey_file* The private key file. The private key is used for signing
- cert_file* The certificate file. The certificate is used as the <KeyInfo> part of the <Signature>; <KeyInfo> will be used for the other end to verify this <Signature>
- incl_namespaces* InclusiveNamespaces for Tranform in Signature

5.371.3.5 bool Arc::XMLSecNode::VerifyNode (const std::string & *id_name*, const std::string & *ca_file*, const std::string & *ca_path*, bool *verify_trusted* = true)

Verify the signature under this node

Parameters:

- id_name* The id of this node, which is used for identifying the node
- ca_file* The CA file which used as trused certificate when verify the certificate in the <KeyInfo> part of <Signature>
- ca_path* The CA directory; either ca_file or ca_path should be set.

The documentation for this class was generated from the following file:

- XMLSecNode.h
